Chapter 1

PictureCrypt

Project made using QT Creator in C++

1.1 The idea of the project

The idea came to me, when I read an article about steganography. I realised, that you can store data in an image in pixels near the border, so noone can see and even if they did, it is practically impossible to decipher the contents.

1.2 Realisation

To create the encrypted image, you need to select any file for encryption, then using [EncryptDialog](#) you select the image to store the data. Then output image is generated.

Attention

Output image format available is .PNG, because .jpg isn't lossless, so the pixels containing data would be seriously simplified and the data damaged. .BMP isn't used, because noone really uses it and .PNG is just compressed .BMP (more or less)

Note

JPHS support is under development :D

1.3 How can someone use it?

Well... Anyone who wants to securely communicate. For example your boss watches your inbox, so you do the work and don't chat with your friends about the bar, they've just visited. Using this app you can send them a photo of your desk, saying it's my new working space, but inside the image there is secret message saying "Wanna get another beer tonight? xD". Boss sees this image, but doesn't spot anything. Great example...

1.4 Structure of the project.

Project is done via MVC Pattern. View and Model layers are totally isolated and run on different threads.

Code from controller.cpp

```
view = new ViewPC();
```

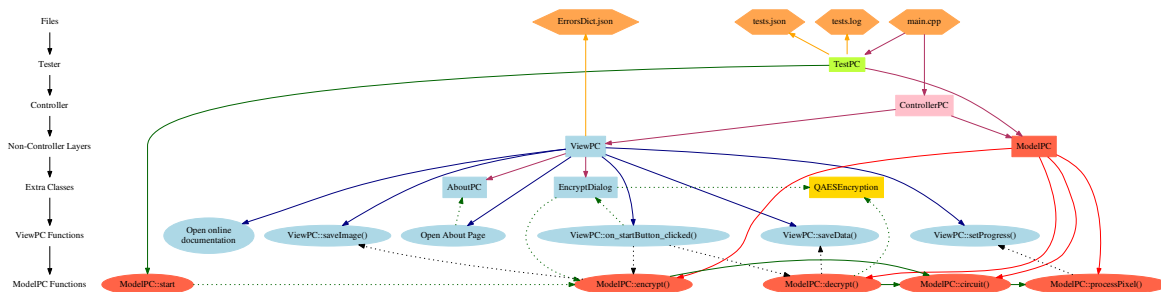

```

model = new ModelPC(version);
QThread * modelThread = new QThread();
model->moveToThread(modelThread);
modelThread->start();

```

So when Model is hard-working, View layer is just fine.

Layers also have a ton of functions, so here is a scheme, that I was doing for about 10 hours, which demonstrates the most important functions and classes in the project. And everything is clickable here, so try it out!

Well... I think you didn't quite understand what is happening here... So hop into my "User-friendly" Documentation!

See source on <https://github.com/waleko/PictureCrypt>

Note

QAESEncryption class done by **Bricke**

1.5 External use

ModelPC class can be used externally (without UI)

Note

TestPC class was introduced recently, its use is advised.

```

#include <modelpc.h>
#include <testpc.h>
#include <QByteArray>
#include <QImage>

#include <QDebug> // Just for demonstration use

...

if(TestPC::Test())
    return;
ModelPC * model = new ModelPC();

// Embedding
QImage * resultImage = model->start(QByteArray data, // Data to be embedded
                                   QImage *image, // Image for embedding
                                   int mode = 0, // Mode of embedding
                                   QString key = "", // Key for extra-encryption (if empty, key will be
                                   generated automatically)
                                   int bitsUsed = 8, // Bits per Byte used (better explanation
                                   ModelPC::bitsUsed)
                                   QString *error = nullptr); // Error output, if everything is ok, error
                                   will be "ok"
if(*error != "ok")
    return;
// Note *error is just a code of error (like "muchdata", dictionary of error codes is also available on
// github.

// De-embedding
QByteArray output = model->decrypt(QImage * image, // Image with hidden data
                                   QString *error = nullptr); // Error output
if(data == output)
    qDebug() << "Great success!";
else
    qDebug() << "Fiasco :(";

```

1.6 JPBS use

The newer versions of the app have jpbs support, but they don't have jpbs built in as it is provided under GNU General Public License v3.0, is "for test purposes only" and is illegal in some countries, so...

Attention

We support JPBS, but we don't use any responsibility for it, we never used or downloaded it, we just used .exe output in the web, and it somehow works by chance. All responsibility for using jpbs is on you, that is why we use made only optionally. That means that to use jpbs with our app you will have to download the jpbs yourself and specify the jpbs directory. However we provide link to the site where you can download the supported version of the jpbs: <http://linux01.gwdg.de/~alatham/stego.html> As it's not our site publishing the dangerous zip file, we just put link to that site (Google does that too, so what? Sue Google?), This text is subject to United Nations' Universal Declaration of Human Rights, (see Article 19 <http://www.un.org/en/universal-declaration-human-rights>):

Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.

And I typed this link randomly, and I'm scared...

Chapter 2

Namespace Index

2.1 Namespace List

Here is a list of all namespaces with brief descriptions:

ErrorsDictSetup	13
tests-setup	13
Ui	14

Chapter 3

Hierarchical Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

QDialog	
AboutPC	15
EncryptDialog	20
QMainWindow	
ViewPC	52
QObject	
ControllerPC	17
ModelPC	25
QAESEncryption	40
TestPC	49

Chapter 4

Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

AboutPC	The About Page dialog	15
ControllerPC	The ControllerPC class Controller class, which controls View and Model layers	17
EncryptDialog	Class to get the image and key to store secret info	20
ModelPC	The ModelPC class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by ControllerPC	25
QAESEncryption	Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: https://github.com/bricke/Qt-AES	40
TestPC	AutoTest for ModelPC Currently used in main.cpp	49
ViewPC	View layer of the app. Controls EncryptDialog and ProgressDialog	52

Chapter 5

File Index

5.1 File List

Here is a list of all files with brief descriptions:

aboutpc.cpp	63
aboutpc.h	64
controllerpc.cpp	65
controllerpc.h	66
encryptdialog.cpp	67
encryptdialog.h	69
ErrorsDict.json	70
ErrorsDictSetup.py	71
main.cpp	71
modelpc.cpp	72
modelpc.h	79
qaesencryption.cpp	83
qaesencryption.h	90
testpc.cpp	92
testpc.h	95
tests-setup.py	95
tests.json	96
viewpc.cpp	97
viewpc.h	100

Chapter 6

Definition at line 4 of file [ErrorsDictSetup.py](#).

6.2 tests-setup Namespace Reference

Variables

- string `filename` = 'tests.json'
- tuple `raw` = open(`filename`, 'r')
- tuple `js` = json.load(`raw`)
- tuple `input_data` = input()
- list `arr` = []

- dictionary `obj` = {'data':data, 'image':image,'expectation':expect,'mode':int(mode),'key':key,'bitsUsed':int(bits-Used)}

6.2.1 Variable Documentation

6.2.1.1 list tests-setup.arr = []

Definition at line 16 of file [tests-setup.py](#).

6.2.1.2 string tests-setup.filename = 'tests.json'

Definition at line 2 of file [tests-setup.py](#).

6.2.1.3 tuple tests-setup.input_data = input()

Definition at line 14 of file [tests-setup.py](#).

6.2.1.4 tuple tests-setup.js = json.load(raw)

Definition at line 6 of file [tests-setup.py](#).

6.2.1.5 dictionary tests-setup.obj = {'data':data, 'image':image,'expectation':expect,'mode':int(mode),'key':key,'bitsUsed':int(bits-Used)}

Definition at line 20 of file [tests-setup.py](#).

6.2.1.6 tuple tests-setup.raw = open(filename, 'r')

Definition at line 4 of file [tests-setup.py](#).

6.3 Ui Namespace Reference

Chapter 7

Class Documentation

7.1 AboutPC Class Reference

The [AboutPC](#) class The About Page dialog.

```
#include <aboutpc.h>
```

Inheritance diagram for AboutPC:

Collaboration diagram for AboutPC:

Public Member Functions

- [AboutPC](#) (QWidget *parent=0)
- [~AboutPC](#) ()
- void [setVersion](#) (QString version)

[AboutPC::setVersion](#) Function to set the version display.

7.1.1 Detailed Description

The [AboutPC](#) class The About Page dialog.

Definition at line 12 of file [aboutpc.h](#).

7.1.2 Constructor & Destructor Documentation

7.1.2.1 [AboutPC::AboutPC](#) (QWidget * *parent* = 0) [explicit]

Definition at line 4 of file [aboutpc.cpp](#).

7.1.2.2 [AboutPC::~~AboutPC](#) ()

Definition at line 11 of file [aboutpc.cpp](#).

7.1.3 Member Function Documentation

7.1.3.1 void [AboutPC::setVersion](#) (QString *version*)

[AboutPC::setVersion](#) Function to set the version display.

Parameters

<i>version</i>	Version as QString
----------------	--------------------

Definition at line 19 of file [aboutpc.cpp](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- [aboutpc.h](#)
- [aboutpc.cpp](#)

7.2 ControllerPC Class Reference

The [ControllerPC](#) class Controller class, which controls View and Model layers.

```
#include <controllerpc.h>
```

Inheritance diagram for ControllerPC:

Collaboration diagram for ControllerPC:

Public Slots

- void [abortCircuit](#) ()
[ControllerPC::abortCircuit](#) Slot to be called when ProgressDialog in [ViewPC](#) is closed. It flags [ModelPC](#) to stop.
- void [runTests](#) ()
[ControllerPC::runTests](#) Runs tests.
- void [setJPHSDir](#) (QString dir)
[ControllerPC::setJPHSDir](#) Sets JPHS default dir.

Public Member Functions

- [ControllerPC](#) ()
[ControllerPC::ControllerPC](#) Constructor of controller Constructor runs auto-test for [ModelPC](#), creates Model Class ([ModelPC](#)) and View Class ([ViewPC](#)). All signals and slots are connected here.

Public Attributes

- long int [version](#)
version Version of the app
- QString [versionString](#)
versionString Version of the app as QString.

7.2.1 Detailed Description

The [ControllerPC](#) class Controller class, which controls View and Model layers.

See Also

[ViewPC](#), [ModelPC](#)

Definition at line 21 of file [controllerpc.h](#).

7.2.2 Constructor & Destructor Documentation

7.2.2.1 ControllerPC::ControllerPC ()

[ControllerPC::ControllerPC](#) Constructor of controller Constructor runs auto-test for [ModelPC](#), creates Model Class ([ModelPC](#)) and View Class ([ViewPC](#)). All signals and slots are connected here.

Controller class

Note

Version of the app is specified here.

Definition at line 9 of file [controllerpc.cpp](#).

Here is the call graph for this function:

7.2.3 Member Function Documentation

7.2.3.1 void ControllerPC::abortCircuit () [slot]

[ControllerPC::abortCircuit](#) Slot to be called when ProgressDialog in [ViewPC](#) is closed. It flags [ModelPC](#) to stop.

Definition at line 36 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

7.2.3.2 void ControllerPC::runTests () [slot]

[ControllerPC::runTests](#) Runs tests.

Definition at line 43 of file [controllerpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.2.3.3 void ControllerPC::setJPHSDir (QString dir) [slot]

[ControllerPC::setJPHSDir](#) Sets JPHS default dir.

Parameters

<i>dir</i>	Directory
------------	-----------

Definition at line 54 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

7.2.4 Member Data Documentation

7.2.4.1 `long int ControllerPC::version`

version Version of the app

Definition at line 29 of file [controllerpc.h](#).

7.2.4.2 `QString ControllerPC::versionString`

versionString Version of the app as QString.

Definition at line 33 of file [controllerpc.h](#).

The documentation for this class was generated from the following files:

- [controllerpc.h](#)
- [controllerpc.cpp](#)

7.3 EncryptDialog Class Reference

The [EncryptDialog](#) class Class to get the image and key to store secret info.

```
#include <encryptdialog.h>
```

Inheritance diagram for EncryptDialog:

Collaboration diagram for EncryptDialog:

Public Slots

- void `on_fileButton_clicked ()`
EncryptDialog::on_fileButton_clicked Slot to select the image.
- void `on_buttonBox_accepted ()`
EncryptDialog::on_buttonBox_accepted Slot to start the encryption. Successful closing of the app.
- void `on_buttonBox_rejected ()`
EncryptDialog::on_buttonBox_rejected Slot to reject the encryption.
- void `on_bitsSlider_valueChanged (int value)`
EncryptDialog::on_bitsSlider_valueChanged Slot if value of the bits slider is changed.

Public Member Functions

- `EncryptDialog (QByteArray _data, QWidget *parent=0)`
EncryptDialog::EncryptDialog Constructor of the class. Input data is saved here and some variables are set here.
- `~EncryptDialog ()`
- `QByteArray zip ()`
EncryptDialog::zip Zipping algorithm It copresses the data and then compresses it using `qCompress()`

Public Attributes

- `QByteArray data`
data Input data
- `bool success`
success Flag, if image was successfully selected and data was encrypted.
- `QByteArray compr_data`
compr_data Compressed data, aka Output data.
- `QString inputFileName`
inputFileName Filename of the image.
- `long long int size`
size Size of the image in square pixels
- `QString key`
key Key to be used for encryption in *EncryptDialog::zip*
- `bool goodPercentage`
goodPercentage Flag if area of the used data via encryption is less than 70% of the area of the image.

- int [val](#)
val Value of the slider
- int [bitsUsed](#)
bitsUsed Bits used per byte of pixel.
- QImage [image](#)
image Inputted image

7.3.1 Detailed Description

The [EncryptDialog](#) class Class to get the image and key to store secret info.

Note

Not the most important and well written class.

See Also

[ViewPC](#)

Definition at line 21 of file [encryptdialog.h](#).

7.3.2 Constructor & Destructor Documentation

7.3.2.1 [EncryptDialog::EncryptDialog](#) ([QByteArray](#) *_data*, [QWidget](#) * *parent* = 0) [\[explicit\]](#)

[EncryptDialog::EncryptDialog](#) Constructor of the class. Input data is saved here and some variables are set here.

Parameters

<i>_data</i>	Input data.
<i>parent</i>	Parent (not in use)

Definition at line 9 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

7.3.2.2 [EncryptDialog::~~EncryptDialog](#) ()

Definition at line 26 of file [encryptdialog.cpp](#).

7.3.3 Member Function Documentation

7.3.3.1 [void EncryptDialog::on_bitsSlider_valueChanged](#) ([int](#) *value*) [\[slot\]](#)

[EncryptDialog::on_bitsSlider_valueChanged](#) Slot if value of the bits slider is changed.

Parameters

<i>value</i>	Well, value
--------------	-------------

Definition at line 107 of file [encryptdialog.cpp](#).

7.3.3.2 void EncryptDialog::on_buttonBox_accepted () [slot]

[EncryptDialog::on_buttonBox_accepted](#) Slot to start the encryption. Successful closing of the app.

Definition at line 82 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

7.3.3.3 void EncryptDialog::on_buttonBox_rejected () [slot]

[EncryptDialog::on_buttonBox_rejected](#) Slot to reject the encryption.

Definition at line 98 of file [encryptdialog.cpp](#).

7.3.3.4 void EncryptDialog::on_fileButton_clicked () [slot]

[EncryptDialog::on_fileButton_clicked](#) Slot to select the image.

Definition at line 57 of file [encryptdialog.cpp](#).

7.3.3.5 QByteArray EncryptDialog::zip ()

[EncryptDialog::zip](#) Zipping algorithm It copresses the data and then compresses it using qCompress()

Returns

Returns Compressed data.

See Also

[ModelPC::unzip](#)

Definition at line 46 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.3.4 Member Data Documentation

7.3.4.1 `int` `EncryptDialog::bitsUsed`

`bitsUsed` Bits used per byte of pixel.

See Also

[ModelPC::circuit](#)

Definition at line 75 of file [encryptdialog.h](#).

7.3.4.2 `QByteArray` `EncryptDialog::compr_data`

`compr_data` Compressed data, aka Output data.

Definition at line 50 of file [encryptdialog.h](#).

7.3.4.3 `QByteArray` `EncryptDialog::data`

`data` Input data

Definition at line 42 of file [encryptdialog.h](#).

7.3.4.4 `bool` `EncryptDialog::goodPercentage`

`goodPercentage` Flag if area of the used data via encryption is less than 70% of the area of the image.

Definition at line 66 of file [encryptdialog.h](#).

7.3.4.5 `QImage` `EncryptDialog::image`

`image` Inputted image

Definition at line 79 of file [encryptdialog.h](#).

7.3.4.6 `QString` `EncryptDialog::inputFileName`

`inputFileName` Filename of the image.

Definition at line 54 of file [encryptdialog.h](#).

7.3.4.7 QString EncryptDialog::key

key Key to be used for encryption in EncrytDialog::zip

Definition at line 62 of file [encryptdialog.h](#).

7.3.4.8 long long int EncryptDialog::size

size Size of the image in square pixels

Definition at line 58 of file [encryptdialog.h](#).

7.3.4.9 bool EncryptDialog::success

success Flag, if image was successfully selected and data was encrypted.

Definition at line 46 of file [encryptdialog.h](#).

7.3.4.10 int EncryptDialog::val

val Value of the slider

Definition at line 70 of file [encryptdialog.h](#).

The documentation for this class was generated from the following files:

- [encryptdialog.h](#)
- [encryptdialog.cpp](#)

7.4 ModelPC Class Reference

The [ModelPC](#) class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by [ControllerPC](#).

```
#include <modelpc.h>
```

Inheritance diagram for ModelPC:

Collaboration diagram for ModelPC:

Public Slots

- QImage * [start](#) (QByteArray data, QImage *image, int mode=0, QString key="", int _bitsUsed=8, QString *_error=nullptr)
ModelPC::start Slot to zip and encrypt data and provide it with some extra stuff After completion start standard *ModelPC::encrypt* Isn't used in PictureCrypt, but used can be used in other - custom projects.
- QImage * [encrypt](#) (QByteArray encr_data, QImage *image, int mode=0, int _bitsUsed=8, QString *_error=nullptr)
ModelPC::encrypt Slot to be called when encrypt mode in *ViewPC* is selected and started.
- QByteArray [decrypt](#) (QImage *image, QString key, QString *_error=nullptr)
ModelPC::decrypt Slot to be called when decrypt mode in *ViewPC* is selected and started.
- void [fail](#) (QString message)
ModelPC::fail Slot to stop execution of crypton.

Signals

- void [alertView](#) (QString messageCode, bool isWarning)
alertView Signal to be called to create MessageBox.
- void [saveData](#) (QByteArray data)
saveData Signal to be called to save data from *ModelPC::decrypt*.
- void [saveImage](#) (QImage *image)
saveImage Signal to be called to save image from *ModelPC::encrypt*.
- void [setProgress](#) (int val)
setProgress Signal to be called to set progress of ProgressDialog.

Public Member Functions

- [ModelPC](#) ()
ModelPC::ModelPC Constructor Unit tests are run here.
- QByteArray [unzip](#) (QByteArray data, QByteArray key)
ModelPC::unzip Unzip data from *ModelPC::decrypt*. Just mirrored *EncryptDialog::zip*.
- void [alert](#) (QString message, bool isWarning=false)
ModelPC::alert Function emits signal *ModelPC::alertView* and calls *ViewPC::alert*.

Static Public Member Functions

- static QImage * [Start](#) (QByteArray data, QImage *image, int mode=0, QString key="", int _bitsUsed=8, QString *_error=nullptr)
- static QImage * [Encrypt](#) (QByteArray encr_data, QImage *image, int mode=0, int _bitsUsed=8, QString *_error=nullptr)
- static QByteArray [Decrypt](#) (QImage *image, QString key, QString *_error=nullptr)

Public Attributes

- bool [success](#)
success Flag that true by default, but in case of error or cancelling of ProgressDialog it turns to false, which stops execution of [ModelPC::circuit](#)
- long [version](#)
version Version of the class
- QString [versionString](#)
versionString Version as string
- int [curMode](#)
curMode Mode of en- or decryption
- int [bitsUsed](#)
bitsUsed Bits per byte used in pixel
- QString [defaultJPHSDir](#)
defaultJPHSDir Default JPHS directory
- QString * [error](#)
error Current error

Protected Member Functions

- void [circuit](#) (QImage *image, QByteArray *data, long long int countBytes)
[ModelPC::circuit](#) The brain of the app. Via special circuit stores data in image.
- void [jphs](#) (QImage *image, QByteArray *data)
[ModelPC::jphs](#) JPHS function to use jphide and jpseek (currently under development)
- void [processPixel](#) (QPoint pos, QVector< QPoint > *were, bool isEncrypt)
[ModelPC::processPixel](#) Processes every pixel. Reads its contains or writes data.
- QByteArray [zip](#) (QByteArray data, QByteArray key)
[ModelPC::zip](#) Zip function, copy of [EncryptDialog::zip](#) Used for [ModelPC](#) in custom projects, other than PictureCrypt.
- void [modernCircuit](#) (QImage *image, QByteArray *data, long long int countBytes)

7.4.1 Detailed Description

The [ModelPC](#) class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by [ControllerPC](#).

7.4.3 Member Function Documentation

7.4.3.1 void ModelPC::alert (QString message, bool isWarning = false)

[ModelPC::alert](#) Function emits signal [ModelPC::alertView](#) and calls [ViewPC::alert](#).

Parameters

<i>message</i>	Message to be transmitted.
<i>isWarning</i>	Flag if message is critical.

See Also

[ViewPC::alert](#)

Definition at line 636 of file [modelpc.cpp](#).

Here is the caller graph for this function:

7.4.3.2 void ModelPC::alertView (QString *messageCode*, bool *isWarning*) [signal]

alertView Signal to be called to create MessageBox.

Parameters

<i>messageCode</i>	Message Code to be shown.
<i>isWarning</i>	Flag if message is critical.

See Also

[ModelPC::alert](#), [ViewPC::alert](#)

Here is the caller graph for this function:

7.4.3.3 void ModelPC::circuit (QImage * *image*, QByteArray * *data*, long long int *countBytes*) [protected]

[ModelPC::circuit](#) The brain of the app. Via special circuit stores data in image.

The circuit itself can be found in documentation or in commentaries in source.

Parameters

<i>image</i>	Image to be processed.
<i>data</i>	Data to be processed.
<i>countBytes</i>	Number of bytes to be read or written.

See Also

[ModelPC::processPixel](#)

Definition at line 324 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.3.4 QByteArray ModelPC::Decrypt (QImage * *image*, QString *key*, QString * *_error* = nullptr) [static]

Definition at line 36 of file [modelpc.cpp](#).

Here is the call graph for this function:

7.4.3.5 QByteArray ModelPC::decrypt (QImage * *image*, QString *key*, QString * *_error* = nullptr) [slot]

[ModelPC::decrypt](#) Slot to be called when decrypt mode in [ViewPC](#) is selected and started.

Parameters

<i>image</i>	Image to be decrypted.
<i>key</i>	Keyphrase with which the data is encrypted
<i>_error</i>	Error output

Returns

Returns decrypted data

See Also

[ViewPC::on_startButton_clicked](#), [ModelPC::encrypt](#), [ModelPC::circuit](#)

Definition at line 169 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.3.6 `QImage * ModelPC::Encrypt (QByteArray encr_data, QImage * image, int mode = 0, int _bitsUsed = 8, QString * _error = nullptr) [static]`

Definition at line 31 of file [modelpc.cpp](#).

Here is the call graph for this function:

7.4.3.7 `QImage * ModelPC::encrypt (QByteArray encr_data, QImage * image, int mode = 0, int _bitsUsed = 8, QString * _error = nullptr) [slot]`

[ModelPC::encrypt](#) Slot to be called when encrypt mode in [ViewPC](#) is selected and started.

Parameters

<i>encr_data</i>	Data to be inserted to an image.
------------------	----------------------------------

<i>image</i>	Image to be inserted in.
<i>mode</i>	Mode of encryption
<i>_bitsUsed</i>	Bits per byte used
<i>_error</i>	Error output

Returns

Returns image with embedded data.

See Also

Definition at line 110 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.3.8 `void ModelPC::fail (QString message) [slot]`

[ModelPC::fail](#) Slot to stop execution of crypton.

Parameters

<i>message</i>	Message for user
----------------	------------------

Definition at line 251 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.3.9 void ModelPC::jphs (QImage * *image*, QByteArray * *data*) [protected]

[ModelPC::jphs](#) JPHS function to use jphide and jpseek (currently under development)

Parameters

<i>image</i>	Image for embedding
<i>data</i>	Data

Definition at line 263 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.3.10 `void ModelPC::modernCircuit (QImage * image, QByteArray * data, long long int countBytes)` [protected]

Definition at line 584 of file [modelpc.cpp](#).

Here is the caller graph for this function:

7.4.3.11 `void ModelPC::processPixel (QPoint pos, QVector< QPoint > * were, bool isEncrypt)` [protected]

[ModelPC::processPixel](#) Processes every pixel. Reads its contains or writes data.

Parameters

<i>pos</i>	Position of pixel
<i>were</i>	Vector array containing pixels, that were already processed.
<i>isEncrypt</i>	Mode of operation. If true encryption operations will continue, else the decryption ones.

Definition at line 465 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.3.12 `void ModelPC::saveData (QByteArray data)` [signal]

`saveData` Signal to be called to save data from [ModelPC::decrypt](#).

Parameters

<i>data</i>	Data to be saved.
-------------	-------------------

Here is the caller graph for this function:

7.4.3.13 void ModelPC::saveImage (QImage * *image*) [signal]

`saveImage` Signal to be called to save image from `ModelPC::encrypt`.

Parameters

<i>image</i>	Image to be saved.
--------------	--------------------

Here is the caller graph for this function:

7.4.3.14 void ModelPC::setProgress (int *val*) [signal]

`setProgress` Signal to be called to set progress of `ProgressDialog`.

Parameters

<i>val</i>	Value to be set.
------------	------------------

See Also

[ViewPC::setProgress](#)

Here is the caller graph for this function:

7.4.3.15 `QImage * ModelPC::Start (QByteArray data, QImage * image, int mode = 0, QString key = "", int _bitsUsed = 8, QString * _error = nullptr) [static]`

Definition at line 26 of file [modelpc.cpp](#).

Here is the call graph for this function:

7.4.3.16 `QImage * ModelPC::start (QByteArray data, QImage * image, int mode = 0, QString key = "", int _bitsUsed = 8, QString * _error = nullptr) [slot]`

[ModelPC::start](#) Slot to zip and encrypt data and provide it with some extra stuff After completion start standard [ModelPC::encrypt](#) Isn't used in PictureCrypt, but used can be used in other - custom projects.

Parameters

<i>data</i>	Data for embedding
<i>image</i>	Image for embedding
<i>mode</i>	Mode for embedding
<i>key</i>	Key for extra encryption
<i>_bitsUsed</i>	Bits per byte (see ModelPC::bitsUsed)
<i>_error</i>	Error output

Returns

Returns image with embedded data

See Also

[ModelPC::encrypt](#)

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.3.17 QByteArray ModelPC::unzip (QByteArray *data*, QByteArray *key*)

[ModelPC::unzip](#) Unzip data from [ModelPC::decrypt](#). Just mirrored [EncryptDialog::zip](#).

Parameters

<i>data</i>	Data to be decrypted.
<i>key</i>	Key to decrypt the data.

Returns

Returns data

See Also

[EncryptDialog::zip](#), [ModelPC::decrypt](#), [ModelPC::zip](#)

Definition at line 558 of file [modelpc.cpp](#).

7.4.4.1 int ModelPC::bitsUsed

bitsUsed Bits per byte used in pixel

Definition at line 91 of file [modelpc.h](#).

7.4.4.2 int ModelPC::curMode

curMode Mode of en- or decryption

Definition at line 87 of file [modelpc.h](#).

7.4.4.3 QString ModelPC::defaultJPHSDir

defaultJPHSDir Default JPHS directory

Definition at line 95 of file [modelpc.h](#).

7.4.4.4 QString* ModelPC::error

error Current error

Definition at line 99 of file [modelpc.h](#).

7.4.4.5 bool ModelPC::success

success Flag that true by default, but in case of error or cancelling of ProgressDialog it turns to false, which stops execution of [ModelPC::circuit](#)

Definition at line 75 of file [modelpc.h](#).

7.4.4.6 long ModelPC::version

version Version of the class

Definition at line 79 of file [modelpc.h](#).

7.4.4.7 QString ModelPC::versionString

versionString Version as string

Definition at line 83 of file [modelpc.h](#).

The documentation for this class was generated from the following files:

- [modelpc.h](#)
- [modelpc.cpp](#)

7.5 QAESEncryption Class Reference

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/Qt-AES>.

```
#include <qaesencryption.h>
```

Inheritance diagram for QAESEncryption:

Collaboration diagram for QAESEncryption:

Public Types

- enum [Aes](#) { [AES_128](#), [AES_192](#), [AES_256](#) }
The Aes enum AES Level AES Levels The class supports all AES key lengths.
- enum [Mode](#) { [ECB](#), [CBC](#), [CFB](#), [OFB](#) }
The Mode enum AES Mode The class supports the following operating modes ECB CBC CFB OFB.
- enum [Padding](#) { [ZERO](#), [PKCS7](#), [ISO](#) }
The Padding enum Padding By default the padding method is ISO, however, the class supports:

Public Member Functions

- [QAESEncryption](#) ([QAESEncryption::Aes](#) level, [QAESEncryption::Mode](#) mode, [QAESEncryption::Padding](#) padding=[QAESEncryption::ISO](#))
- QByteArray [encode](#) (const QByteArray &rawText, const QByteArray &key, const QByteArray &iv=NULL)
encode Encodes data with AES
- QByteArray [decode](#) (const QByteArray &rawText, const QByteArray &key, const QByteArray &iv=NULL)
decode Decodes data with AES
- QByteArray [removePadding](#) (const QByteArray &rawText)
RemovePadding Removes padding.
- QByteArray [expandKey](#) (const QByteArray &key)
ExpandKey Expands the key.

Static Public Member Functions

- static QByteArray [Crypt](#) ([QAESEncryption::Aes](#) level, [QAESEncryption::Mode](#) mode, const QByteArray &rawText, const QByteArray &key, const QByteArray &iv=NULL, [QAESEncryption::Padding](#) padding=[QAESEncryption::ISO](#))
Crypt Static encode function.
- static QByteArray [Decrypt](#) ([QAESEncryption::Aes](#) level, [QAESEncryption::Mode](#) mode, const QByteArray &rawText, const QByteArray &key, const QByteArray &iv=NULL, [QAESEncryption::Padding](#) padding=[QAESEncryption::ISO](#))
Decrypt Static decode function.
- static QByteArray [ExpandKey](#) ([QAESEncryption::Aes](#) level, [QAESEncryption::Mode](#) mode, const QByteArray &key)
ExpandKey Expands the key.
- static QByteArray [RemovePadding](#) (const QByteArray &rawText, [QAESEncryption::Padding](#) padding)
RemovePadding Removes padding.

7.5.1 Detailed Description

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/Qt-AES>.

Author

Bricke (Matteo B)

Definition at line 14 of file [qaesencryption.h](#).

7.5.2 Member Enumeration Documentation

7.5.2.1 enum QAESEncryption::Aes

The Aes enum AES Level AES Levels The class supports all AES key lengths.

AES_128 AES_192 AES_256

Enumerator

AES_128

AES_192

AES_256

Definition at line 27 of file [qaesencryption.h](#).

7.5.2.2 enum QAESEncryption::Mode

The Mode enum AES Mode The class supports the following operating modes ECB CBC CFB OFB.

Enumerator

ECB

CBC

CFB

OFB

Definition at line 40 of file [qaesencryption.h](#).

7.5.2.3 enum QAESEncryption::Padding

The Padding enum Padding By default the padding method is ISO, however, the class supports:

ZERO PKCS7 ISO

Enumerator

ZERO

PKCS7

ISO

7.5.3 Constructor & Destructor Documentation

7.5.3.1 QAESEncryption::QAESEncryption (QAESEncryption::Aes *level*, QAESEncryption::Mode *mode*, QAESEncryption::Padding *padding* = QAESEncryption::ISO)

Definition at line 67 of file [qaesencryption.cpp](#).

Here is the caller graph for this function:

7.5.4 Member Function Documentation

7.5.4.1 QByteArray QAESEncryption::Crypt (QAESEncryption::Aes *level*, QAESEncryption::Mode *mode*, const QByteArray & *rawText*, const QByteArray & *key*, const QByteArray & *iv* = NULL, QAESEncryption::Padding *padding* = QAESEncryption::ISO) [static]

Crypt Static encode function.

Parameters

<i>level</i>	AES level of encryption
<i>mode</i>	AES mode
<i>rawText</i>	Input data
<i>key</i>	Key for encryption
<i>iv</i>	IV vector
<i>padding</i>	Padding

Returns

Returns encrypted data

See Also

[QAESEncryption::encode](#), [QAESEncryption::Decrypt](#)

Definition at line 6 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.5.4.2 QByteArray QAESEncryption::decode (const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL)

decode Decodes data with AES

Note

Basically the non-static method of [QAESEncryption::Decrypt](#)

Parameters

<i>rawText</i>	Input data
<i>key</i>	Key
<i>iv</i>	IV vector

Returns

Returns decoded data

See Also

[QAESEncryption::Decrypt](#), [QAESEncryption::encode](#)

Definition at line 441 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.5.4.3 `QByteArray QAESEncryption::Decrypt (QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL, QAESEncryption::Padding padding = QAESEncryption::ISO) [static]`

Decrypt Static decode function.

Parameters

<i>level</i>	AES level of encryption
<i>mode</i>	AES mode
<i>rawText</i>	Encrypted data
<i>key</i>	Key for encryption
<i>iv</i>	IV vector
<i>padding</i>	Padding

Returns

Returns Decrypted data

See Also

[QAESEncryption::decode](#), [QAESEncryption::Crypt](#)

Definition at line 12 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

7.5.4.4 `QByteArray QAESEncryption::encode (const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL)`

encode Encodes data with AES

Note

Basically the non-static method of [QAESEncryption::Crypt](#)

Parameters

<i>rawText</i>	Input data
<i>key</i>	Key
<i>iv</i>	IV vector

Returns

Returns encoded data

See Also

[QAESEncryption::Crypt](#), [QAESEncryption::decode](#)

Definition at line 391 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

7.5.4.5 `QByteArray QAES encryption::ExpandKey (QAES encryption::Aes level, QAES encryption::Mode mode, const QByteArray & key) [static]`

ExpandKey Expands the key.

Parameters

<i>level</i>	AES level
<i>mode</i>	AES Mode
<i>key</i>	key

Returns

Returns expanded key (I guess)

See Also

[QAES encryption::expandKey](#)

Definition at line 18 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

7.5.4.6 `QByteArray QAES encryption::expandKey (const QByteArray & key)`

ExpandKey Expands the key.

Note

Basically the non-static method of [QAES encryption::ExpandKey](#)

Parameters

<i>key</i>	key
------------	-----

Returns

Returns expanded key (I guess)

See Also

[QAESEncryption::ExpandKey](#)

Definition at line 132 of file [qaesencryption.cpp](#).

Here is the caller graph for this function:

7.5.4.7 `QByteArray QAESEncryption::RemovePadding (const QByteArray & rawText, QAESEncryption::Padding padding) [static]`

`RemovePadding` Removes padding.

Parameters

<i>rawText</i>	Input data
<i>padding</i>	Padding

Returns

Returns data with removed padding (I guess)

See Also

[QAESEncryption::removePadding](#)

Definition at line 23 of file [qaesencryption.cpp](#).

7.5.4.8 `QByteArray QAESEncryption::removePadding (const QByteArray & rawText)`

`RemovePadding` Removes padding.

Note

Basically the non-static method of [QAESEncryption::RemovePadding](#)

Parameters

<i>rawText</i>	Input data
----------------	------------

Returns

Returns data with removed padding (I guess)

See Also

[QAESEncryption::RemovePadding](#)

7.6.3 Member Function Documentation

7.6.3.1 int [TestPC::startTest](#) () [slot]

[TestPC::startTest](#) Starts the tests running.

Note

Tests are configured in [tests.json](#)

Returns

Returns success of all tests

See Also

TestPC::autoTests

Definition at line 52 of file [testpc.cpp](#).

7.6.3.2 int TestPC::Test () [static]

[TestPC::Test](#) Static function of testing.

Returns

Returns result of the testing

Definition at line 13 of file [testpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.6.3.3 bool TestPC::test (QByteArray data, QImage rImage, QString expectedOutput = "ok", int mode = 0, QString key = "", int bitsUsed = 8) [protected], [slot]**

[TestPC::test](#) Function calling TestPC::model for tests.

Parameters

<i>data</i>	Data for test
<i>rImage</i>	Image for test
<i>expectedOutput</i>	Expected output for test ("ok" if everything is well... ok, else errorcode from ErrorsDict.json)

<i>mode</i>	Mode for embedding
<i>key</i>	Key for for test
<i>bitsUsed</i>	Bits Used

Returns

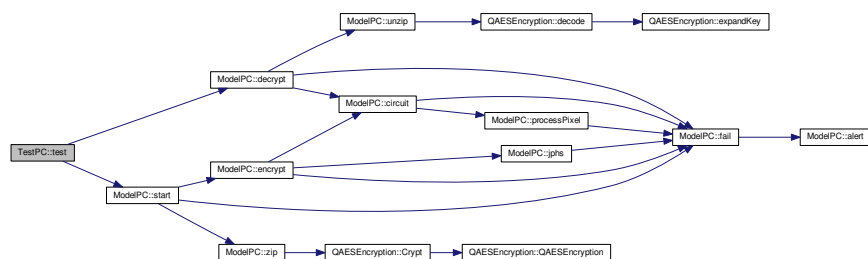

Returns if test is successful

7.7 ViewPC Class Reference

The [ViewPC](#) class View layer of the app. Controls [EncryptDialog](#) and [ProgressDialog](#).

```
#include <viewpc.h>
```

Inheritance diagram for ViewPC:

Collaboration diagram for ViewPC:

Public Slots

- void [alert](#) (QString message, bool isWarning=false)
ViewPC::alert Slot to create QMessageBox with message.
- void [saveData](#) (QByteArray Edata)
ViewPC::saveData Slot to be called to save data using QFileDialog.
- void [saveImage](#) (QImage *image)
ViewPC::saveImage Slot to be called to save image using QFileDialog.
- void [setProgress](#) (int val)
ViewPC::setProgress Slot to set the value of the ProgressDialog (*ViewPC::dialog*).
- void [abortCircuit](#) ()
ViewPC::abortCircuit Slot to close ProgressDialog (*ViewPC::dialog*)
- void [setEncryptMode](#) (bool encr)
ViewPC::setEncryptMode Set the encrpt mode (*ViewPC::isEncrypt*)
- void [setVersion](#) (QString version)
ViewPC::setVersion Set the version of the app from *ControllerPC*.

Signals

- void [encrypt](#) (QByteArray data, QImage *image, int mode, int bitsUsed)
encrypt Signal calling *ModelPC::encrypt*
- void [decrypt](#) (QImage *_image, QString key)
decrypt Signal calling *ModelPC::decrypt*
- void [abortModel](#) ()
abortModel Signal calling to stop *ModelPC::circuit*
- void [setJPHSDir](#) (QString dir)
setJPHSPath Sets the default JPHS directory
- void [runTests](#) ()
runTests Runs tests in *ControllerPC* via *TestPC*

Public Member Functions

- [ViewPC](#) (QWidget *parent=nullptr)
- [~ViewPC](#) ()
ViewPC::~ViewPC Simple destructor for this layer.

Public Attributes

- QProgressDialog * [dialog](#)
dialog ProgressDialog used.
- bool [progressDialogClosed](#)
progressDialogClosed Flag, if dialog is closed.
- QJsonObject [errorsDict](#)

Protected Slots

- void [on_fileButton_clicked](#) ()
ViewPC::on_fileButton_clicked Slot to be called, when according button is pressed.
- void [on_startButton_clicked](#) ()
ViewPC::on_startButton_clicked Slot to be called, when Start Button is pressed.
- void [on_actionAbout_triggered](#) ()
ViewPC::on_actionAbout_triggered Opens about page.
- void [on_actionHelp_triggered](#) ()
ViewPC::on_actionHelp_triggered Opens online documentation.

Protected Member Functions

- QString [requestKey](#) ()
ViewPC::requestKey Request keyphrase from user using InputDialog.

7.7.1 Detailed Description

The [ViewPC](#) class View layer of the app. Controls [EncryptDialog](#) and ProgressDialog.

See Also

[ControllerPC](#), [ModelPC](#), [EncryptDialog](#)

Definition at line 35 of file [viewpc.h](#).

7.7.2 Constructor & Destructor Documentation

7.7.2.1 ViewPC::ViewPC (QWidget * parent = nullptr) [explicit]

Definition at line 4 of file [viewpc.cpp](#).

Here is the call graph for this function:

7.7.2.2 ViewPC::~~ViewPC ()

[ViewPC::~~ViewPC](#) Simple destructor for this layer.

Definition at line 28 of file [viewpc.cpp](#).

7.7.3 Member Function Documentation

7.7.3.1 void ViewPC::abortCircuit () [slot]

[ViewPC::abortCircuit](#) Slot to close ProgressDialog ([ViewPC::dialog](#))

Definition at line 222 of file [viewpc.cpp](#).

Here is the caller graph for this function:

7.7.3.2 void ViewPC::abortModel () [signal]

`abortModel` Signal calling to stop [ModelPC::circuit](#)

Here is the caller graph for this function:

7.7.3.3 void ViewPC::alert (QString message, bool isWarning = false) [slot]

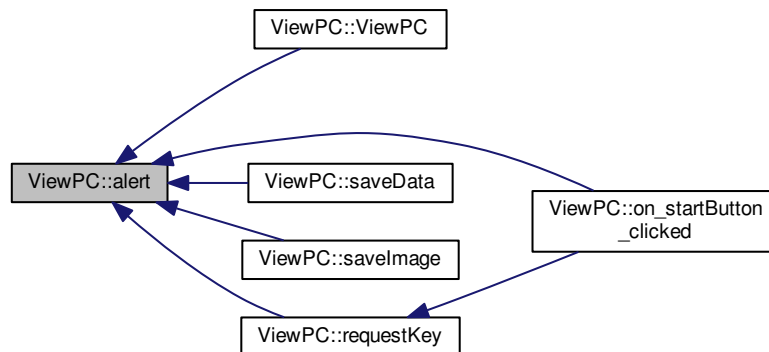

[ViewPC::alert](#) Slot to create QMessageBox with message.

Parameters

<i>message</i>	Message to be shown
<i>isWarning</i>	Flag, if message is critical.

Definition at line 136 of file [viewpc.cpp](#).

Here is the caller graph for this function:

7.7.3.4 void ViewPC::decrypt (QImage * _image, QString key) [signal]

decrypt Signal calling [ModelPC::decrypt](#)

Parameters

<i>_image</i>	Image for decryption
<i>key</i>	encryption key

Here is the caller graph for this function:

7.7.3.5 void ViewPC::encrypt (QByteArray data, QImage * image, int mode, int bitsUsed) [signal]

encrypt Signal calling [ModelPC::encrypt](#)

Parameters

<i>data</i>	Data to write
<i>image</i>	Image to be encrypted into.
<i>mode</i>	Mode of encryption
<i>bitsUsed</i>	Bits used per byte

Here is the caller graph for this function:

7.7.3.6 `void ViewPC::on_actionAbout_triggered () [protected], [slot]`

[ViewPC::on_actionAbout_triggered](#) Opens about page.

Definition at line 277 of file [viewpc.cpp](#).

Here is the call graph for this function:

7.7.3.7 `void ViewPC::on_actionHelp_triggered () [protected], [slot]`

[ViewPC::on_actionHelp_triggered](#) Opens online documentation.

Definition at line 287 of file [viewpc.cpp](#).

7.7.3.8 `void ViewPC::on_fileButton_clicked () [protected], [slot]`

[ViewPC::on_fileButton_clicked](#) Slot to be called, when according button is pressed.

Definition at line 47 of file [viewpc.cpp](#).

7.7.3.9 `void ViewPC::on_startButton_clicked () [protected], [slot]`

[ViewPC::on_startButton_clicked](#) Slot to be called, when Start Button is pressed.

7.7.4 Encrypting

If Encrypting mode is active the data from text browser or from file from file selector will be opened and checked in size.

Note

File size limit is 16MB

Then the [EncryptDialog](#) opens and image and key is selected. Then the [ViewPC::encrypt](#) signal is called to start [ModelPC::encrypt](#)

7.7.5 Decrypting

Else, the image from file selector is transmitted to [ModelPC::decrypt](#)

Definition at line 69 of file [viewpc.cpp](#).

Here is the call graph for this function:

7.7.5.1 QString ViewPC::requestKey () [protected]

[ViewPC::requestKey](#) Request keyphrase from user using InputDialog.

Returns

Returns keyphrase

Definition at line 257 of file [viewpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.7.5.2 void ViewPC::runTests () [signal]

runTests Runs tests in [ControllerPC](#) via [TestPC](#)

7.7.5.3 void ViewPC::saveData (QByteArray *Edata*) [slot]

[ViewPC::saveData](#) Slot to be called to save data using QFileDialog.

Parameters

<i>Edata</i>	Encrypted data to be saved.
--------------	-----------------------------

See Also

[ModelPC::encrypt](#)

Definition at line 157 of file [viewpc.cpp](#).

Here is the call graph for this function:

7.7.5.4 void ViewPC::saveImage (QImage * *image*) [slot]

[ViewPC::saveImage](#) Slot to be called to save image using QFileDialog.

Parameters

<i>image</i>	Image to be saved.
--------------	--------------------

See Also

[ModelPC::decrypt](#)

Definition at line 178 of file [viewpc.cpp](#).

Here is the call graph for this function:

7.7.5.5 void ViewPC::setEncryptMode (bool *encr*) [slot]

[ViewPC::setEncryptMode](#) Set the encrpt mode (ViewPC::isEncrypt)

Parameters

<i>encr</i>	
-------------	--

Definition at line 235 of file [viewpc.cpp](#).

7.7.5.6 void ViewPC::setJPHSDir (QString *dir*) [signal]

setJPHSPath Sets the default JPHS directory

Parameters

<i>dir</i>	Directory
------------	-----------

7.7.5.7 void ViewPC::setProgress (int *val*) [slot]

[ViewPC::setProgress](#) Slot to set the value of the ProgressDialog ([ViewPC::dialog](#)).

Parameters

<i>val</i>	New value of the dialog. If -1, creates ProgressDialog, if 101 closes the dialog.
------------	---

See Also

[ViewPC::abortCircuit\(\)](#), [ModelPC::setProgress\(\)](#)

Definition at line 196 of file [viewpc.cpp](#).

Here is the call graph for this function:

7.7.5.8 void ViewPC::setVersion (QString *version*) [slot]

[ViewPC::setVersion](#) Set the version of the app from [ControllerPC](#).

Parameters

<i>version</i>	Version as QString
----------------	--------------------

Definition at line 248 of file [viewpc.cpp](#).

Here is the caller graph for this function:

7.7.6 Member Data Documentation

7.7.6.1 `QProgressDialog*` `ViewPC::dialog`

`dialog` `ProgressDialog` used.

See Also

[ViewPC::setProgress](#), [ViewPC::cancel](#), [ModelPC::setProgress](#)

Definition at line 100 of file [viewpc.h](#).

7.7.6.2 `QJsonObject` `ViewPC::errorsDict`

Definition at line 106 of file [viewpc.h](#).

7.7.6.3 `bool` `ViewPC::progressDialogClosed`

`progressDialogClosed` Flag, if dialog is closed.

See Also

[ViewPC::abortCircuit](#), [ViewPC::setProgress](#)

Definition at line 105 of file [viewpc.h](#).

Classes

- class [QAESEncryption](#)

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/-Qt-AES>.
