## Chapter 1

# PictureCrypt

Project made using QT Creator in C++

### 1.1 About

A simple cross-platform steganography project which hides data in images. This project is built using MVC pattern and features GUI. [Qt](#) and [QAESEncryption](#) by [bricke](#) were used. You can read more about project at the [home page](#)

### 1.2 Structure of the project

As written earlier this project is structured with MVC pattern. Here is a small graph showing the basic structure.

## 1.3 External use

You can use [ModelPC](#) class separately from View and Control layer. You will need four files:

- [modelpc.cpp](#)
- [modelpc.h](#)
- [aes/qaesencryption.cpp](#)
- [aes/qaesencryption.h](#)

Then you can just `#include "modelpc.h"` and use API.

### 1.3.1 API

Here is are the most important methods:

- [ModelPC::Encrypt](#)
- [ModelPC::Decrypt](#)

#### 1.3.1.1 Showcase

```
// Includes
#include "modelpc.h"
#include <QImage>
#include <QByteArray>
#include <QString>
#include <QDebug> // just for showcase

...

// Basic setup
QByteArray data("some_file.txt");
QImage *image = new QImage("some_big_enough_image.jpg");
QString key = "some_password";
int bitsUsed = 3; // must be from 1 to 8

// Encrypting
QString error1, error2;
QImage *normal_resultImage = ModelPC::Encrypt(
    data,
    image,
    1,
    key,
    bitsUsed,
    &error1);
QImage *advanced_resultImage = ModelPC::Encrypt(
    data,
    image,
    2, key,
    bitsUsed /* not really used here, so put here any number from 1 to 8*/,
    &error2);

// Decrypting with given mode
QString error3, error4, error5, error6;
QByteArray output_normal = ModelPC::Decrypt(
    normal_resultImage,
    key,
    1,
    &error3);
QByteArray output_advanced = ModelPC::Decrypt(
    advanced_resultImage,
    key,
    2,
    &error4);
```

```
// Decrypting without given mode
// PictureCrypt can detect the mode of the image and adapt.
QByteArray output_normal_undefined = ModelPC::Decrypt(
    normal_resultImage,
    key,
    0,
    &error5);
QByteArray output_advanced_undefined = ModelPC::Decrypt(
    advanced_resultImage,
    key,
    0,
    &error6);

// Check (better testing with [running tests] (#run-tests))
bool data_good =
    data == output_normal &&
    data == output_advanced &&
    data == output_normal_undefined &&
    data == output_advanced_undefined;
bool no_errors =
    error1 == "ok" &&
    error2 == "ok" &&
    error3 == "ok" &&
    error4 == "ok" &&
    error5 == "ok" &&
    error6 == "ok";
if (data_good && no_errors)
    qDebug() << "PASS";
else
    qDebug() << "FAIL";
```

## Chapter 2

# Namespace Index

### 2.1 Namespace List

Here is a list of all namespaces with brief descriptions:

Ui . . . . .	13
--------------	----

## Chapter 3

# Hierarchical Index

### 3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

QDialog	
AboutPC . . . . .	15
EncryptDialog . . . . .	20
QMainWindow	
ViewPC . . . . .	53
QObject	
ControllerPC . . . . .	17
ModelIPC . . . . .	25
QAESEncryption . . . . .	45

## Chapter 4

# Class Index

### 4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">AboutPC</a>	The About Page dialog . . . . .	15
<a href="#">ControllerPC</a>	The <a href="#">ControllerPC</a> class Controller class, which controls View and Model layers . . . . .	17
<a href="#">EncryptDialog</a>	Class to get the image and key to store secret info . . . . .	20
<a href="#">ModelPC</a>	The <a href="#">ModelPC</a> class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by <a href="#">ControllerPC</a> . . . . .	25
<a href="#">QAESEncryption</a>	Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <a href="https://github.com/bricke/Qt-AES">https://github.com/bricke/Qt-AES</a> . . . . .	45
<a href="#">ViewPC</a>	View layer of the app. Controls <a href="#">EncryptDialog</a> and ProgressDialog . . . . .	53

## Chapter 5

# File Index

### 5.1 File List

Here is a list of all files with brief descriptions:

<a href="#">aboutpc.cpp</a>	65
<a href="#">aboutpc.h</a>	66
<a href="#">controllerpc.cpp</a>	67
<a href="#">controllerpc.h</a>	68
<a href="#">encryptdialog.cpp</a>	69
<a href="#">encryptdialog.h</a>	70
<a href="#">main.cpp</a>	72

# **Namespace Documentation**

### **6.1 Ui Namespace Reference**

## Chapter 7

# Class Documentation

### 7.1 AboutPC Class Reference

The [AboutPC](#) class The About Page dialog.

```
#include <aboutpc.h>
```

Inheritance diagram for AboutPC:

Collaboration diagram for AboutPC:

## Public Member Functions

- [AboutPC](#) (QWidget \*parent=0)
- [~AboutPC](#) ()
- void [setVersion](#) (QString version)  
[AboutPC::setVersion](#) Function to set the version display.

### 7.1.1 Detailed Description

The [AboutPC](#) class The About Page dialog.

Definition at line 12 of file [aboutpc.h](#).

### 7.1.2 Constructor & Destructor Documentation

7.1.2.1 [AboutPC::AboutPC](#) ( QWidget \* *parent* = 0 ) [explicit]

Definition at line 4 of file [aboutpc.cpp](#).

7.1.2.2 [AboutPC::~~AboutPC](#) ( )

Definition at line 11 of file [aboutpc.cpp](#).

### 7.1.3 Member Function Documentation

7.1.3.1 void [AboutPC::setVersion](#) ( QString *version* )

[AboutPC::setVersion](#) Function to set the version display.

Parameters

<i>version</i>	Version as QString
----------------	--------------------

Definition at line 19 of file [aboutpc.cpp](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- [aboutpc.h](#)
- [aboutpc.cpp](#)

## 7.2 ControllerPC Class Reference

The [ControllerPC](#) class Controller class, which controls View and Model layers.

```
#include <controllerpc.h>
```

Inheritance diagram for ControllerPC:

Collaboration diagram for ControllerPC:

### Public Slots

- void [abortCircuit](#) ()  
*[ControllerPC::abortCircuit](#) Slot to be called when ProgressDialog in [ViewPC](#) is closed. It flags [ModelPC](#) to stop.*
- void [setJPHSDir](#) (QString dir)  
*[ControllerPC::setJPHSDir](#) Sets JPHS default dir.*

## Public Member Functions

- [ControllerPC](#) ( )

[ControllerPC::ControllerPC](#) Constructor of controller Constructor runs auto-test for [ModelPC](#), creates Model Class ([ModelPC](#)) and View Class ([ViewPC](#)). All signals and slots are connected here.

## Public Attributes

- long int [version](#)

*version* Version of the app

- QString [versionString](#)

*versionString* Version of the app as QString.

### 7.2.1 Detailed Description

The [ControllerPC](#) class Controller class, which controls View and Model layers.

See also

[ViewPC](#), [ModelPC](#)

Definition at line 20 of file [controllerpc.h](#).

### 7.2.2 Constructor & Destructor Documentation

#### 7.2.2.1 ControllerPC::ControllerPC ( )

[ControllerPC::ControllerPC](#) Constructor of controller Constructor runs auto-test for [ModelPC](#), creates Model Class ([ModelPC](#)) and View Class ([ViewPC](#)). All signals and slots are connected here.

Controller class

Note

Version of the app is specified here.

Definition at line 9 of file [controllerpc.cpp](#).

Here is the call graph for this function:

### 7.2.3 Member Function Documentation

#### 7.2.3.1 void ControllerPC::abortCircuit ( ) [slot]

[ControllerPC::abortCircuit](#) Slot to be called when ProgressDialog in [ViewPC](#) is closed. It flags [ModelPC](#) to stop.

Definition at line 36 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

#### 7.2.3.2 void ControllerPC::setJPHSDir ( QString dir ) [slot]

[ControllerPC::setJPHSDir](#) Sets JPHS default dir.

##### Parameters

<i>dir</i>	Directory
------------	-----------

Definition at line 44 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

### 7.2.4 Member Data Documentation

#### 7.2.4.1 long int ControllerPC::version

version Version of the app

Definition at line 28 of file [controllerpc.h](#).

#### 7.2.4.2 QString ControllerPC::versionString

versionString Version of the app as QString.

Definition at line 32 of file [controllerpc.h](#).

The documentation for this class was generated from the following files:

- [controllerpc.h](#)
- [controllerpc.cpp](#)

### 7.3 EncryptDialog Class Reference

The [EncryptDialog](#) class Class to get the image and key to store secret info.

```
#include <encryptdialog.h>
```

Inheritance diagram for EncryptDialog:

Collaboration diagram for EncryptDialog:

## Public Slots

- void [on\\_fileButton\\_clicked](#) ()  
*EncryptDialog::on\_fileButton\_clicked* Slot to select the image.
- void [on\\_buttonBox\\_accepted](#) ()  
*EncryptDialog::on\_buttonBox\_accepted* Slot to start the encryption. Successful closing of the app.
- void [on\\_buttonBox\\_rejected](#) ()  
*EncryptDialog::on\_buttonBox\_rejected* Slot to reject the encryption.
- void [on\\_bitsSlider\\_valueChanged](#) (int value)  
*EncryptDialog::on\_bitsSlider\_valueChanged* Slot if value of the bits slider is changed.

## Public Member Functions

- [EncryptDialog](#) (QByteArray \_data, QWidget \*parent=0)  
*EncryptDialog::EncryptDialog* Constructor of the class. Input data is saved here and some variables are set here.
- [~EncryptDialog](#) ()
- QByteArray [zip](#) ()  
*EncryptDialog::zip* Zipping algorithm It copresses the data and then compresses it using qCompress()

## Public Attributes

- QByteArray [data](#)  
*data* Input data
- bool [success](#)  
*success* Flag, if image was successfully selected and data was encrypted.
- QByteArray [compr\\_data](#)  
*compr\_data* Compressed data, aka Output data.
- QString [inputFileName](#)  
*inputFileName* Filename of the image.
- long long int [size](#)  
*size* Size of the image in square pixels
- QString [key](#)  
*key* Key to be used for encryption in *EncryptDialog::zip*
- bool [goodPercentage](#)  
*goodPercentage* Flag if area of the used data via encryption is less than 70% of the area of the image.
- int [val](#)  
*val* Value of the slider
- int [bitsUsed](#)  
*bitsUsed* Bits used per byte of pixel.
- QImage [image](#)  
*image* Inputted image

### 7.3.1 Detailed Description

The [EncryptDialog](#) class Class to get the image and key to store secret info.

#### Note

Not the most important and well written class.

#### See also

[ViewPC](#)

Definition at line 21 of file [encryptdialog.h](#).

### 7.3.2 Constructor & Destructor Documentation

#### 7.3.2.1 `EncryptDialog::EncryptDialog ( QByteArray _data, QWidget * parent = 0 ) [explicit]`

[EncryptDialog::EncryptDialog](#) Constructor of the class. Input data is saved here and some variables are set here.

Parameters

<code>_data</code>	Input data.
<code>parent</code>	Parent (not in use)

Definition at line 9 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

#### 7.3.2.2 `EncryptDialog::~~EncryptDialog ( )`

Definition at line 26 of file [encryptdialog.cpp](#).

### 7.3.3 Member Function Documentation

#### 7.3.3.1 `void EncryptDialog::on_bitsSlider_valueChanged ( int value ) [slot]`

[EncryptDialog::on\\_bitsSlider\\_valueChanged](#) Slot if value of the bits slider is changed.

Parameters

<code>value</code>	Well, value
--------------------	-------------

Definition at line 107 of file [encryptdialog.cpp](#).

#### 7.3.3.2 `void EncryptDialog::on_buttonBox_accepted ( ) [slot]`

[EncryptDialog::on\\_buttonBox\\_accepted](#) Slot to start the encryption. Successful closing of the app.

Definition at line 82 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

#### 7.3.3.3 void EncryptDialog::on\_buttonBox\_rejected ( ) [slot]

[EncryptDialog::on\\_buttonBox\\_rejected](#) Slot to reject the encryption.

Definition at line 98 of file [encryptdialog.cpp](#).

#### 7.3.3.4 void EncryptDialog::on\_fileButton\_clicked ( ) [slot]

[EncryptDialog::on\\_fileButton\\_clicked](#) Slot to select the image.

Definition at line 57 of file [encryptdialog.cpp](#).

#### 7.3.3.5 QByteArray EncryptDialog::zip ( )

[EncryptDialog::zip](#) Zipping algorithm It copresses the data and then compresses it using qCompress()

Returns

Returns Compressed data.

See also

[ModelPC::unzip](#)

Definition at line 46 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 7.3.4 Member Data Documentation

#### 7.3.4.1 int EncryptDialog::bitsUsed

bitsUsed Bits used per byte of pixel.

See also

[ModelPC::circuit](#)

Definition at line 75 of file [encryptdialog.h](#).

#### 7.3.4.2 QByteArray EncryptDialog::compr\_data

compr\_data Compressed data, aka Output data.

Definition at line 50 of file [encryptdialog.h](#).

#### 7.3.4.3 QByteArray EncryptDialog::data

data Input data

Definition at line 42 of file [encryptdialog.h](#).

#### 7.3.4.4 bool EncryptDialog::goodPercentage

goodPercentage Flag if area of the used data via encryption is less than 70% of the area of the image.

Definition at line 66 of file [encryptdialog.h](#).

#### 7.3.4.5 QImage EncryptDialog::image

image Inputted image

Definition at line 79 of file [encryptdialog.h](#).

#### 7.3.4.6 QString EncryptDialog::inputFileName

inputFileName Filename of the image.

Definition at line 54 of file [encryptdialog.h](#).

#### 7.3.4.7 QString EncryptDialog::key

key Key to be used for encryption in EncryptDialog::zip

Definition at line 62 of file [encryptdialog.h](#).

#### 7.3.4.8 long long int EncryptDialog::size

size Size of the image in square pixels

Definition at line 58 of file [encryptdialog.h](#).

#### 7.3.4.9 bool EncryptDialog::success

success Flag, if image was successfully selected and data was encrypted.

Definition at line 46 of file [encryptdialog.h](#).

#### 7.3.4.10 int EncryptDialog::val

val Value of the slider

Definition at line 70 of file [encryptdialog.h](#).

The documentation for this class was generated from the following files:

- [encryptdialog.cpp](#)

## 7.4 ModelPC Class Reference

The [ModelPC](#) class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by [ControllerPC](#).

```
#include <modelpc.h>
```

Inheritance diagram for ModelPC:

Collaboration diagram for ModelPC:

## Public Types

- enum `CryptMode` { `NotDefined`, `v1_3`, `v1_4`, `jphs_mode` }

## Public Slots

- QImage \* `encrypt` (QByteArray data, QImage \*image, int \_mode, QString key="", int \_bitsUsed=8, QString \*\_error=NULLPTR)  
*ModelPC::encrypt* Slot to zip and inject data and provide it with some extra stuff After completion start standard  
*ModelPC::inject* Isn't used in PictureCrypt, but used can be used in other - custom projects.
- QByteArray `decrypt` (QImage \*image, QString key, int \_mode=0, QString \*\_error=NULLPTR)  
*ModelPC::decrypt* Slot to be called when decrypt mode in *ViewPC* is selected and started.
- void `fail` (QString message)  
*ModelPC::fail* Slot to stop execution of crypton.
- void `alert` (QString message, bool isWarning=false)  
*ModelPC::alert* Function emits signal *ModelPC::alertView* and calls *ViewPC::alert*.

## Signals

- void `alertView` (QString messageCode, bool isWarning)  
*alertView* Signal to be called to create MessageBox.
- void `saveData` (QByteArray data)  
*saveData* Signal to be called to save data from *ModelPC::decrypt*.
- void `saveImage` (QImage \*image)  
*saveImage* Signal to be called to save image from *ModelPC::encrypt*.
- void `setProgress` (int val)  
*setProgress* Signal to be called to set progress of ProgressDialog.

## Public Member Functions

- `ModelPC` ()  
*ModelPC::ModelPC* Constructor Unit tests are run here.
- QByteArray `unzip` (QByteArray data, QByteArray key)  
*ModelPC::unzip* Unzip data from *ModelPC::decrypt*. Just mirrored *EncryptDialog::zip*.

## Static Public Member Functions

- static QImage \* [Encrypt](#) (QByteArray data, QImage \*image, int \_mode, QString key="", int \_bitsUsed=8, QString \*\_error=nullptr)
- static QByteArray [Decrypt](#) (QImage \*image, QString key, int \_mode=0, QString \*\_error=nullptr)

## Public Attributes

- bool [success](#)  
*success Flag that true by default, but in case of error or cancelling of ProgressDialog it turns to false, which stops execution of [ModelPC::circuit](#)*
- long [version](#)  
*version Version of the class*
- QString [versionString](#)  
*versionString Version as string*
- QString [defaultJPHSDir](#)  
*defaultJPHSDir Default JPHS directory*

## Protected Slots

- QImage \* [inject](#) (QByteArray encr\_data, QImage \*image, int \_mode, int \_bitsUsed=8, QString \*\_error=nullptr)  
*[ModelPC::inject](#) Slot to be called when encrypt mode in [ViewPC](#) is selected and started.*

## Protected Member Functions

- void [circuit](#) (QImage \*image, QByteArray \*data, long long int countBytes)  
*[ModelPC::circuit](#) The brain of the app. Via special circuit stores data in image.*
- void [jphs](#) (QImage \*image, QByteArray \*data)  
*[ModelPC::jphs](#) JPHS function to use jphide and jpseek (currently under development)*
- void [processPixel](#) (QPoint pos, QVector< QPoint > \*were, bool isEncrypt)  
*[ModelPC::processPixel](#) Processes every pixel. Reads its contains or writes data.*
- void [encryptv1\\_4](#) (QImage \*image, QByteArray data, QString key)  
*[ModelPC::encryptv1\\_4](#) Encrypts and injects data to image used in v1.4+.*
- QByteArray [decryptv1\\_3](#) (QImage \*image, QString key)  
*[ModelPC::decryptv1\\_3](#) Decrypts data from image in v1.3.*
- QByteArray [decryptv1\\_4](#) (QImage \*image, QString key)  
*[ModelPC::decryptv1\\_4](#) Decrypts data from image in v1.4+.*
- void [proccessPixelsv1\\_4](#) (QImage \*image, QByteArray \*data, QByteArray key, bool isEncrypt, QVector< QPair< QPoint, QPair< int, int > > > \*were, long long size=-1)  
*[ModelPC::proccessPixelsv1\\_4](#) Hides (or retrieves) data to/from pixels.*
- QByteArray [zip](#) (QByteArray data, QByteArray key)  
*[ModelPC::zip](#) Zip function, copy of [EncryptDialog::zip](#) Used for [ModelPC](#) in custom projects, other than PictureCrypt.*

## Static Protected Member Functions

- static QImage \* [Inject](#) (QByteArray encr\_data, QImage \*image, int \_mode, int \_bitsUsed=8, QString \*\_error=nullptr)

## Protected Attributes

- `QString * error`  
*error Current error*

### 7.4.1 Detailed Description

The [ModelPC](#) class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by [ControllerPC](#).

#### 7.4.4 Member Function Documentation

7.4.4.1 `void ModelPC::alert ( QString message, bool isWarning = false ) [slot]`

[ModelPC::alert](#) Function emits signal [ModelPC::alertView](#) and calls [ViewPC::alert](#).

Parameters

<i>message</i>	Message to be transmitted.
<i>isWarning</i>	Flag if message is critical.

See also

[ViewPC::alert](#)

Definition at line 941 of file [modelpc.cpp](#).

Here is the caller graph for this function:

#### 7.4.4.2 void ModelPC::alertView ( QString *messageCode*, bool *isWarning* ) [signal]

alertView Signal to be called to create MessageBox.

##### Parameters

<i>messageCode</i>	Message Code to be shown.
<i>isWarning</i>	Flag if message is critical.

##### See also

[ModelPC::alert](#), [ViewPC::alert](#)

Here is the caller graph for this function:

#### 7.4.4.3 void ModelPC::circuit ( QImage \* *image*, QByteArray \* *data*, long long int *countBytes* ) [protected]

[ModelPC::circuit](#) The brain of the app. Via special circuit stores data in image.

The circuit itself can be found in documentation or in commentaries in source.

## Parameters

<i>image</i>	Image to be processed.
<i>data</i>	Data to be processed.
<i>countBytes</i>	Number of bytes to be read or written.

## See also

[ModelPC::processPixel](#)

Definition at line 359 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.4.4.4 QByteArray ModelPC::Decrypt ( QImage \* image, QString key, int \_mode = 0, QString \* \_error = nullptr ) [static]

Definition at line 34 of file [modelpc.cpp](#).

Here is the call graph for this function:

7.4.4.5 `QByteArray ModelPC::decrypt ( QImage * image, QString key, int _mode = 0, QString * _error = nullptr )`  
[slot]

[ModelPC::decrypt](#) Slot to be called when decrypt mode in [ViewPC](#) is selected and started.

## Parameters

<i>image</i>	Image to be decrypted.
<i>key</i>	Keyphrase with which the data is injected
<i>_mode</i>	Mode for decryption
<i>_error</i>	Error output

## Returns

Returns decrypted data

## See also

[ViewPC::on\\_startButton\\_clicked](#), [ModelPC::inject](#), [ModelPC::circuit](#)

Definition at line 212 of file [modelpc.cpp](#).

Here is the call graph for this function:

#### 7.4.4.6 QByteArray ModelPC::decryptv1\_3 ( QImage \* *image*, QString *key* ) [protected]

[ModelPC::decryptv1\\_3](#) Decrypts data from image in v1.3.

## Parameters

<i>image</i>	Image with data
<i>key</i>	Key

## Returns

Returns obtained data

Definition at line 778 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.4.4.7 QByteArray ModelPC::decryptv1\_4 ( QImage \* *image*, QString *key* ) [protected]

[ModelPC::decryptv1\\_4](#) Decrypts data from image in v1.4+.

##### Parameters

<i>image</i>	Image with data
<i>key</i>	Key

##### Returns

Returns obtained data

Definition at line 603 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.4.4.8** `QImage * ModelPC::Encrypt ( QByteArray data, QImage * image, int _mode, QString key = " ", int _bitsUsed = 8, QString *_error = nullptr ) [static]`

Definition at line 24 of file [modelpc.cpp](#).

Here is the call graph for this function:

**7.4.4.9** `QImage * ModelPC::encrypt ( QByteArray data, QImage * image, int _mode, QString key = " ", int _bitsUsed = 8, QString *_error = nullptr ) [slot]`

[ModelPC::encrypt](#) Slot to zip and inject data and provide it with some extra stuff After completion start standard [ModelPC::inject](#) Isn't used in PictureCrypt, but used can be used in other - custom projects.

#### Parameters

<i>data</i>	Data for embedding
<i>image</i>	Image for embedding
<i>_mode</i>	Mode for embedding
<i>key</i>	Key for extra encryption
<i>_bitsUsed</i>	Bits per byte (see <code>ModelPC::bitsUsed</code> )
<i>_error</i>	Error output

#### Returns

Returns image with embedded data

See also

[ModelPC::inject](#)

Definition at line 51 of file [modelpc.cpp](#).

Here is the call graph for this function:

7.4.4.10 `void ModelPC::encryptv1_4 ( QImage * image, QByteArray data, QString key )` [protected]

[ModelPC::encryptv1\\_4](#) Encrypts and injects data to image used in v1.4+.

Parameters

<i>image</i>	Image for injecting
<i>data</i>	Data for embedding
<i>key</i>	Key of encryption

Definition at line 561 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.4.11 void ModelPC::fail ( QString *message* ) [slot]

[ModelPC::fail](#) Slot to stop execution of crypton.

## Parameters

<i>message</i>	Message for user
----------------	------------------

Definition at line 283 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.4.12 QImage \* ModelPC::Inject ( QByteArray *encr\_data*, QImage \* *image*, int *\_mode*, int *\_bitsUsed* = 8, QString \* *\_error* = nullptr ) [static], [protected]

Definition at line 29 of file [modelpc.cpp](#).

Here is the call graph for this function:

**7.4.4.13** `QImage * ModelPC::inject ( QByteArray encr_data, QImage * image, int _mode, int _bitsUsed = 8, QString * _error = nullptr ) [protected],[slot]`

[ModelPC::inject](#) Slot to be called when encrypt mode in [ViewPC](#) is selected and started.

#### Parameters

<i>encr_data</i>	Data to be inserted to an image.
<i>image</i>	Image to be inserted in.
<i>_mode</i>	Mode of encryption
<i>_bitsUsed</i>	Bits per byte used
<i>_error</i>	Error output

#### Returns

Returns image with embedded data.

#### See also

[ViewPC::on\\_startButton\\_clicked](#), [ModelPC::decrypt](#), [ModelPC::circuit](#), [ModelPC::start](#)

Definition at line 139 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.4.4.14** `void ModelPC::jphs ( QImage * image, QByteArray * data )` `[protected]`

[ModelPC::jphs](#) JPHS function to use jpshide and jpseek (currently under development)

Parameters

<i>image</i>	Image for embedding
<i>data</i>	Data

Definition at line [298](#) of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.4.4.15** `void ModelPC::processPixelsv1_4 ( QImage * image, QByteArray * data, QByteArray key, bool isEncrypt, QVector< QPair< QPoint, QPair< int, int > > * were, long long size = -1 )` `[protected]`

[ModelPC::processPixelsv1\\_4](#) Hides (or retrieves) data to/from pixels.

## Parameters

<i>image</i>	Original image
<i>data</i>	Data to write (Pointer to empty QByteArray if decrypting)
<i>key</i>	Key
<i>isEncrypt</i>	Mode of Crypton (true -> encryption, false -> decryption)
<i>were</i>	Were vector for visited pixels
<i>size</i>	Size of reading data, unneeded if writing

Definition at line 664 of file [modelpc.cpp](#).

Here is the caller graph for this function:

7.4.4.16 `void ModelPC::processPixel ( QPoint pos, QVector< QPoint > * were, bool isEncrypt )` [protected]

[ModelPC::processPixel](#) Processes every pixel. Reads its contains or writes data.

## Parameters

<i>pos</i>	Position of pixel
<i>were</i>	Vector array containing pixels, that were already processed.
<i>isEncrypt</i>	Mode of operation. If true encryption operations will continue, else the decryption ones.

Definition at line 500 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.4.4.17 void ModelPC::saveData ( QByteArray *data* ) [signal]

saveData Signal to be called to save data from [ModelPC::decrypt](#).

##### Parameters

<i>data</i>	Data to be saved.
-------------	-------------------

Here is the caller graph for this function:

#### 7.4.4.18 void ModelPC::saveImage ( QImage \* *image* ) [signal]

saveImage Signal to be called to save image from [ModelPC::encrypt](#).

##### Parameters

<i>image</i>	Image to be saved.
--------------	--------------------

Here is the caller graph for this function:

#### 7.4.4.19 void ModelPC::setProgress ( int *val* ) [signal]

setProgress Signal to be called to set progress of ProgressDialog.

##### Parameters

<i>val</i>	Value to be set.
------------	------------------

##### See also

[ViewPC::setProgress](#)

Here is the caller graph for this function:

#### 7.4.4.20 QByteArray ModelPC::unzip ( QByteArray *data*, QByteArray *key* )

[ModelPC::unzip](#) Unzip data from [ModelPC::decrypt](#). Just mirrored [EncryptDialog::zip](#).

##### Parameters

<i>data</i>	Data to be decrypted.
<i>key</i>	Key to decrypt the data.

##### Returns

Returns data

##### See also

[EncryptDialog::zip](#), [ModelPC::decrypt](#), [ModelPC::zip](#)

Definition at line 880 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.4.4.21 QByteArray ModelPC::zip ( QByteArray data, QByteArray key ) [protected]

[ModelPC::zip](#) Zip function, copy of [EncryptDialog::zip](#) Used for [ModelPC](#) in custom projects, other than PictureCrypt.

##### Parameters

<i>data</i>	Data to be encrypted
<i>key</i>	Key for encryption

##### Returns

Returns decrypted data

##### See also

[ModelPC::start](#), [ModelPC::inject](#), [ModelPC::unzip](#)

*ExpandKey Expands the key.*
- static QByteArray [RemovePadding](#) (const QByteArray &rawText, [QAESEncryption::Padding](#) padding)  
*RemovePadding Removes padding.*

### 7.5.1 Detailed Description

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/Qt-AES>.

#### Author

Bricke (Matteo B)

Definition at line 14 of file [qaesencryption.h](#).

### 7.5.2 Member Enumeration Documentation

#### 7.5.2.1 enum [QAESEncryption::Aes](#)

The Aes enum AES Level AES Levels The class supports all AES key lengths.

AES\_128 AES\_192 AES\_256

#### Enumerator

**AES\_128**

**AES\_192**

**AES\_256**

Definition at line 27 of file [qaesencryption.h](#).

## 7.5.2.2 enum QAESEncryption::Mode

The Mode enum AES Mode The class supports the following operating modes ECB CBC CFB OFB.

Enumerator

**ECB**  
**CBC**  
**CFB**  
**OFB**

Definition at line 40 of file [qaesencryption.h](#).

## 7.5.2.3 enum QAESEncryption::Padding

The Padding enum Padding By default the padding method is ISO, however, the class supports:

ZERO PKCS7 ISO

Enumerator

**ZERO**  
**PKCS7**  
**ISO**

Definition at line 55 of file [qaesencryption.h](#).

## 7.5.3 Constructor &amp; Destructor Documentation

## 7.5.3.1 QAESEncryption::QAESEncryption ( QAESEncryption::Aes level, QAESEncryption::Mode mode, QAESEncryption::Padding padding = QAESEncryption::ISO )

Definition at line 67 of file [qaesencryption.cpp](#).

Here is the caller graph for this function:

## 7.5.4 Member Function Documentation

## 7.5.4.1 QByteArray QAESEncryption::Crypt ( QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray &amp; rawText, const QByteArray &amp; key, const QByteArray &amp; iv = NULL, QAESEncryption::Padding padding = QAESEncryption::ISO ) [static]

Crypt Static encode function.

## Parameters

<i>level</i>	AES level of encryption
<i>mode</i>	AES mode
<i>rawText</i>	Input data
<i>key</i>	Key for encryption
<i>iv</i>	IV vector
<i>padding</i>	Padding

## Returns

Returns encrypted data

## See also

[QAESEncryption::encode](#), [QAESEncryption::Decrypt](#)

Definition at line 6 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.5.4.2** `QByteArray QAESEncryption::decode ( const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL )`

`decode` Decodes data with AES

## Note

Basically the non-static method of [QAESEncryption::Decrypt](#)

## Parameters

<i>rawText</i>	Input data
<i>key</i>	Key
<i>iv</i>	IV vector

## Returns

Returns decoded data

## See also

[QAESEncryption::Decrypt](#), [QAESEncryption::encode](#)

Definition at line 441 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.5.4.3** `QByteArray QAESEncryption::Decrypt ( QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL, QAESEncryption::Padding padding = QAESEncryption::ISO ) [static]`

Decrypt Static decode function.

## Parameters

<i>level</i>	AES level of encryption
<i>mode</i>	AES mode
<i>rawText</i>	Encrypted data
<i>key</i>	Key for encrytion
<i>iv</i>	IV vector
<i>padding</i>	Padding

**Returns**

Returns Decrypted data

**See also**

[QAESEncryption::decode](#), [QAESEncryption::Crypt](#)

Definition at line 12 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

**7.5.4.4** `QByteArray QAESEncryption::encode ( const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL )`

encode Encodes data with AES

**Note**

Basically the non-static method of [QAESEncryption::Crypt](#)

**Parameters**

<i>rawText</i>	Input data
<i>key</i>	Key
<i>iv</i>	IV vector

**Returns**

Returns encoded data

**See also**

[QAESEncryption::Crypt](#), [QAESEncryption::decode](#)

Definition at line 391 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

**7.5.4.5** `QByteArray QAES encryption::ExpandKey ( QAES encryption::Aes level, QAES encryption::Mode mode, const QByteArray & key ) [static]`

ExpandKey Expands the key.

Parameters

<i>level</i>	AES level
<i>mode</i>	AES Mode
<i>key</i>	key

Returns

Returns expanded key (I guess)

See also

[QAES encryption::expandKey](#)

Definition at line 18 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

**7.5.4.6** `QByteArray QAES encryption::expandKey ( const QByteArray & key )`

ExpandKey Expands the key.

Note

Basically the non-static method of [QAES encryption::ExpandKey](#)

## Parameters

<i>key</i>	key
------------	-----

## Returns

Returns expanded key (I guess)

## See also

[QAESEncryption::ExpandKey](#)

Definition at line 132 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.5.4.7** `QByteArray QAESEncryption::RemovePadding ( const QByteArray & rawText, QAESEncryption::Padding padding ) [static]`

`RemovePadding` Removes padding.

## Parameters

<i>rawText</i>	Input data
<i>padding</i>	Padding

## Returns

Returns data with removed padding (I guess)

See also

[QAESEncryption::removePadding](#)

Definition at line 23 of file [qaesencryption.cpp](#).

#### 7.5.4.8 QByteArray QAESEncryption::removePadding ( const QByteArray & *rawText* )

RemovePadding Removes padding.

Note

Basically the non-static method of [QAESEncryption::RemovePadding](#)

Parameters

<i>rawText</i>	Input data
----------------	------------

Returns

Returns data with removed padding (I guess)

See also

[QAESEncryption::RemovePadding](#)

Definition at line 490 of file [qaesencryption.cpp](#).

The documentation for this class was generated from the following files:

- [qaesencryption.cpp](#)

## 7.6 ViewPC Class Reference

The [ViewPC](#) class View layer of the app. Controls [EncryptDialog](#) and ProgressDialog.

```
#include <viewpc.h>
```

Inheritance diagram for ViewPC:

Collaboration diagram for ViewPC:

## Public Slots

- void [alert](#) (QString message, bool isWarning=false)  
*ViewPC::alert* Slot to create *QMessageBox* with message.
- void [saveData](#) (QByteArray Edata)  
*ViewPC::saveData* Slot to be called to save data using *QFileDialog*.
- void [saveImage](#) (QImage \*image)  
*ViewPC::saveImage* Slot to be called to save image using *QFileDialog*.
- void [setProgress](#) (int val)  
*ViewPC::setProgress* Slot to set the value of the *ProgressDialog* (*ViewPC::dialog*).
- void [abortCircuit](#) ()  
*ViewPC::abortCircuit* Slot to close *ProgressDialog* (*ViewPC::dialog*)
- void [setEncryptMode](#) (bool encr)  
*ViewPC::setEncryptMode* Set the encrypt mode (*ViewPC::isEncrypt*)
- void [setVersion](#) (QString version)  
*ViewPC::setVersion* Set the version of the app from *ControllerPC*.

## Signals

- void [encrypt](#) (QByteArray data, QImage \*image, int mode, QString key, int bitsUsed)  
*encrypt* Signal calling *ModelPC::encrypt*
- void [inject](#) (QByteArray data, QImage \*image, int mode, int bitsUsed)  
*inject* Signal calling *ModelPC::inject*
- void [decrypt](#) (QImage \*\_image, QString key, int mode)  
*decrypt* Signal calling *ModelPC::decrypt*
- void [abortModel](#) ()  
*abortModel* Signal calling to stop *ModelPC::circuit*
- void [setJPHSDir](#) (QString dir)  
*setJPHSPath* Sets the default JPHS directory

## Public Member Functions

- [ViewPC](#) (QWidget \*parent=nullptr)
- [~ViewPC](#) ()  
*ViewPC::~~ViewPC* Simple destructor for this layer.

## Public Attributes

- QProgressDialog \* [dialog](#)  
*dialog ProgressDialog used.*
- bool [progressDialogClosed](#)  
*progressDialogClosed Flag, if dialog is closed.*
- QMap< QString, QString > [errorsDict](#)  
*errorsDict QMap - Errors dictionary*

*ViewPC::on\_fileButton\_clicked Slot to be called, when according button is pressed.*
- void [on\\_startButton\\_clicked](#) ()  
*ViewPC::on\_startButton\_clicked Slot to be called, when Start Button is pressed.*
- void [on\\_actionAbout\\_triggered](#) ()  
*ViewPC::on\_actionAbout\_triggered Opens about page.*
- void [on\\_actionHelp\\_triggered](#) ()  
*ViewPC::on\_actionHelp\_triggered Opens online documentation.*
- void [setupErrorsDict](#) ()  
*ViewPC::setupErrorsDict Setups errorsDict from strings.xml.*

## Protected Member Functions

- QString [requestKey](#) ()  
*ViewPC::requestKey Request keyphrase from user using InputDialog.*

### 7.6.1 Detailed Description

The [ViewPC](#) class View layer of the app. Controls [EncryptDialog](#) and ProgressDialog.

See also

[ControllerPC](#), [ModelPC](#), [EncryptDialog](#)

Definition at line 35 of file [viewpc.h](#).

### 7.6.2 Constructor & Destructor Documentation

#### 7.6.2.1 ViewPC::ViewPC ( QWidget \* *parent* = nullptr ) [explicit]

Definition at line 4 of file [viewpc.cpp](#).

Here is the call graph for this function:

### 7.6.2.2 ViewPC::~~ViewPC ( )

[ViewPC::~~ViewPC](#) Simple destructor for this layer.

Definition at line 19 of file [viewpc.cpp](#).

Here is the call graph for this function:

## 7.6.3 Member Function Documentation

### 7.6.3.1 void ViewPC::abortCircuit ( ) [slot]

[ViewPC::abortCircuit](#) Slot to close ProgressDialog ([ViewPC::dialog](#))

Definition at line 211 of file [viewpc.cpp](#).

Here is the caller graph for this function:

### 7.6.3.2 void ViewPC::abortModel ( ) [signal]

`abortModel` Signal calling to stop [ModelPC::circuit](#)

Here is the caller graph for this function:

### 7.6.3.3 void ViewPC::alert ( QString message, bool isWarning = false ) [slot]

[ViewPC::alert](#) Slot to create QMessageBox with message.

## Parameters

<i>message</i>	Message to be shown
<i>isWarning</i>	Flag, if message is critical.

Definition at line 125 of file [viewpc.cpp](#).

Here is the caller graph for this function:

7.6.3.4 `void ViewPC::decrypt ( QImage * _image, QString key, int mode ) [signal]`

decrypt Signal calling [ModelPC::decrypt](#)

## Parameters

<i>_image</i>	Image for decryption
<i>key</i>	encryption key
<i>mode</i>	Mode of decryption

## See also

[ModelPC::decrypt](#), [ModelPC::CryptMode](#)

Here is the caller graph for this function:

7.6.3.5 void ViewPC::encrypt ( QByteArray *data*, QImage \* *image*, int *mode*, QString *key*, int *bitsUsed* ) [signal]

encrypt Signal calling [ModelPC::encrypt](#)

#### Parameters

<i>data</i>	Data to write
<i>image</i>	Image to be encrypted into
<i>mode</i>	Mode of encryption
<i>key</i>	Key of encryption
<i>bitsUsed</i>	Bits used per byte

Here is the caller graph for this function:

7.6.3.6 void ViewPC::inject ( QByteArray *data*, QImage \* *image*, int *mode*, int *bitsUsed* ) [signal]

inject Signal calling [ModelPC::inject](#)

#### Parameters

<i>data</i>	Data to write
<i>image</i>	Image to be encrypted into.
<i>mode</i>	Mode of encryption
<i>bitsUsed</i>	Bits used per byte

7.6.3.7 void ViewPC::on\_actionAbout\_triggered ( ) [protected],[slot]

[ViewPC::on\\_actionAbout\\_triggered](#) Opens about page.

Definition at line 268 of file [viewpc.cpp](#).

Here is the call graph for this function:

**7.6.3.8** `void ViewPC::on_actionHelp_triggered ( ) [protected], [slot]`

[ViewPC::on\\_actionHelp\\_triggered](#) Opens online documentation.

Definition at line 278 of file [viewpc.cpp](#).

**7.6.3.9** `void ViewPC::on_fileButton_clicked ( ) [protected], [slot]`

[ViewPC::on\\_fileButton\\_clicked](#) Slot to be called, when according button is pressed.

Definition at line 38 of file [viewpc.cpp](#).

**7.6.3.10** `void ViewPC::on_startButton_clicked ( ) [protected], [slot]`

[ViewPC::on\\_startButton\\_clicked](#) Slot to be called, when Start Button is pressed.

## 7.6.4 Encrypting

If Encrypting mode is active the data from text browser or from file from file selector will be opened and checked in size.

### Note

File size limit is 16MB

Then the [EncryptDialog](#) opens and image and key is selected. Then the [ViewPC::encrypt](#) signal is called to start [ModelPC::encrypt](#)

### 7.6.5 Decrypting

Else, the image from file selector is transmitted to [ModelPC::decrypt](#)

Definition at line 60 of file [viewpc.cpp](#).

Here is the call graph for this function:

#### 7.6.5.1 QString ViewPC::requestKey ( ) [protected]

[ViewPC::requestKey](#) Request keyphrase from user using InputDialog.

Returns

Returns keyphrase

Definition at line 248 of file [viewpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.6.5.2 void ViewPC::saveData ( QByteArray Edata ) [slot]

[ViewPC::saveData](#) Slot to be called to save data using QFileDialog.

## Parameters

<i>Edata</i>	Encrypted data to be saved.
--------------	-----------------------------

## See also

[ModelPC::encrypt](#)

Definition at line 146 of file [viewpc.cpp](#).

Here is the call graph for this function:

### 7.6.5.3 void ViewPC::saveImage ( QImage \* *image* ) [slot]

[ViewPC::saveImage](#) Slot to be called to save image using QFileDialog.

## Parameters

<i>image</i>	Image to be saved.
--------------	--------------------

## See also

[ModelPC::decrypt](#)

Definition at line 167 of file [viewpc.cpp](#).

Here is the call graph for this function:

### 7.6.5.4 void ViewPC::setEncryptMode ( bool *encr* ) [slot]

[ViewPC::setEncryptMode](#) Set the encrpt mode (`ViewPC::isEncrypt`)

## Parameters

<i>encr</i>	= isEncrypt, true if encrypting, false if decrypting
-------------	--

Definition at line 224 of file [viewpc.cpp](#).

Here is the caller graph for this function:

#### 7.6.5.5 void ViewPC::setJPHSDir ( QString *dir* ) [signal]

setJPHSPath Sets the default JPHS directory

## Parameters

<i>dir</i>	Directory
------------	-----------

Here is the caller graph for this function:

#### 7.6.5.6 void ViewPC::setProgress ( int *val* ) [slot]

[ViewPC::setProgress](#) Slot to set the value of the ProgressDialog ([ViewPC::dialog](#)).

## Parameters

<i>val</i>	New value of the dialog. If -1, creates ProgressDialog, if 101 closes the dialog.
------------	---

## See also

[ViewPC::abortCircuit\(\)](#), [ModelPC::setProgress\(\)](#)

Definition at line 185 of file [viewpc.cpp](#).

Here is the call graph for this function:

**7.6.5.7** `void ViewPC::setupErrorsDict ( )` `[protected]`, `[slot]`

[ViewPC::setupErrorsDict](#) Setups errorsDict from strings.xml.

Definition at line 286 of file [viewpc.cpp](#).

Here is the caller graph for this function:

**7.6.5.8** `void ViewPC::setVersion ( QString version )` `[slot]`

[ViewPC::setVersion](#) Set the version of the app from [ControllerPC](#).

Parameters

<i>version</i>	Version as QString
----------------	--------------------

Definition at line 239 of file [viewpc.cpp](#).

Here is the caller graph for this function:

## 7.6.6 Member Data Documentation

### 7.6.6.1 `QProgressDialog*` `ViewPC::dialog`

`dialog` `ProgressDialog` used.

See also

[ViewPC::setProgress](#), [ViewPC::cancel](#), [ModelPC::setProgress](#)

Definition at line 111 of file [viewpc.h](#).

### 7.6.6.2 `QMap<QString, QString>` `ViewPC::errorsDict`

`errorsDict` `QMap` - Errors dictionary

Definition at line 120 of file [viewpc.h](#).

### 7.6.6.3 `bool` `ViewPC::progressDialogClosed`

`progressDialogClosed` Flag, if dialog is closed.

See also

[ViewPC::abortCircuit](#), [ViewPC::setProgress](#)

Definition at line 116 of file [viewpc.h](#).

The documentation for this class was generated from the following files:

- [viewpc.h](#)
- [viewpc.cpp](#)

## Classes

- class [QAESEncryption](#)

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/qt-AES>.
