# Chapter 1

## PictureCrypt

Project made using QT Creator in C++

### 1.1 About

A simple steganography project which hides data in images This project is built using MVC pattern and features GUI. [Qt](#) and [QAESEncryption](#) by [bricke](#) were used.

### 1.2 Download

Get the binary files at [latest release page](#) Or download latest **UNSTABLE** binary file for linux [here](#)

### 1.3 Realisation

To create the encrypted image, you need to select any file for encryption, then using [EncryptDialog](#) you select the image to store the data. Then output image is generated.

#### Attention

Output image format available is .PNG, because .jpg isn't lossless, so the pixels containing data would be seriously simplified and the data damaged. .BMP isn't used, because noone really uses it and .PNG is just compressed .BMP (more or less)

#### Note

JPHS support is under development :D

### 1.4 How can someone use it?

Well... Anyone who wants to securely communicate. For example your boss watches your inbox, so you do the work and don't chat with your friends about the bar, they've just visited. Using this app you can send them a photo of your desk, saying it's my new working space, but inside the image there is secret message saying "Wanna get another beer tonight? xD". Boss sees this image, but doesn't spot anything. Great example...

## 1.5 Structure of the project.

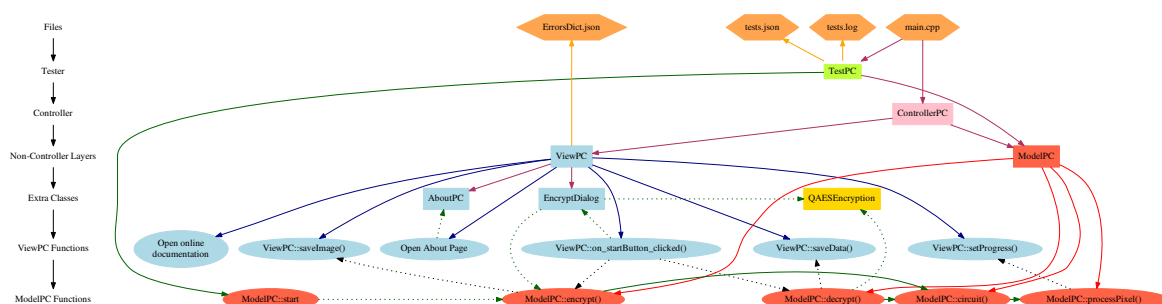

Project is done via MVC Pattern. View and Model layers are totally isolated and run on different threads.

Code from controller.cpp

```
view = new ViewPC();
model = new ModelPC(version);
QThread * modelThread = new QThread();
model->moveToThread(modelThread);
modelThread->start();
```

So when Model is hard-working, View layer is just fine.

Layers also have a ton of functions, so here is a scheme, that I was doing for about 10 hours, which demonstrates the most important functions and classes in the project. And everything is clickable here, so try it out!

Well... I think you didn't quite understand what is happening here... So hop into my "User-friendly" Documentation!

See source on <https://github.com/waleko/PictureCrypt>

Note

QAESEncryption class done by Bricke

## 1.6 External use

ModelPC class can be used externally (without UI)

**Note**

TestPC class was introduced recently, its use is advised.

```
#include <modelpc.h>
#include <testpc.h>
#include <QByteArray>
#include <QImage>

#include <QDebug> // Just for demonstration use

...

if (TestPC::Test())
    return;
ModelPC * model = new ModelPC();

// Embedding
QImage * resultImage = model->start(QByteArray data, // Data to be embedded
                                   QImage *image, // Image for embedding
                                   int mode = 0, // Mode of embedding
                                   QString key = "", // Key for extra-encryption (if empty, key will be
                                   generated automatically)
                                   int bitsUsed = 8, // Bits per Byte used (better explanation
                                   will be "ok"
                                   QString *error = nullptr); // Error output, if everything is ok, error
if (*error != "ok")
    return;
// Note *error is just a code of error (like "muchdata", dictionary of error codes is also available on
// github.

// De-embedding
QByteArray output = model->decrypt(QImage * image, // Image with hidden data
                                   QString *_error = nullptr); // Error output
if (data == output)
    qDebug() << "Great success!";
else
    qDebug() << "Fiasco :(";
```

## 1.7 JPBS use

The newer versions of the app have jpbs support, but they don't have jpbs built in as it is provided under GNU General Public License v3.0, is "for test purposes only" and is illegal in some countries, so...

**Attention**

We support JPBS, but we don't use any responsibility for it, we never used or downloaded it, we just used .exe output in the web, and it somehow works by chance. All responsibility for using jpbs is on you, that is why we use made only optionally. That means that to use jpbs with our app you will have to download the jpbs yourself and specify the jpbs directory. However we provide link to the site where you can download the supported version of the jpbs: <http://linux01.gwdg.de/~alatham/stego.html> As it's not our site publishing the dangerous zip file, we just put link to that site (Google does that too, so what? Sue Google?), This text is subject to United Nations' Universal Declaration of Human Rights, (see Article 19 <http://www.un.org/en/universal-declaration-human-rights>):

Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.

And I typed this link randomly, and I'm scared...

## Chapter 2

# Namespace Index

### 2.1 Namespace List

Here is a list of all namespaces with brief descriptions:

Ui . . . . .	13
--------------	----

## Chapter 3

# Hierarchical Index

### 3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

QDialog	
AboutPC . . . . .	15
EncryptDialog . . . . .	20
QMainWindow	
ViewPC . . . . .	53
QObject	
ControllerPC . . . . .	17
ModelIPC . . . . .	25
QAESEncryption . . . . .	45

## Chapter 4

# Class Index

### 4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">AboutPC</a>	The About Page dialog . . . . .	15
<a href="#">ControllerPC</a>	The <a href="#">ControllerPC</a> class Controller class, which controls View and Model layers . . . . .	17
<a href="#">EncryptDialog</a>	Class to get the image and key to store secret info . . . . .	20
<a href="#">ModelPC</a>	The <a href="#">ModelPC</a> class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by <a href="#">ControllerPC</a> . . . . .	25
<a href="#">QAESEncryption</a>	Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <a href="https://github.com/bricke/Qt-AES">https://github.com/bricke/Qt-AES</a> . . . . .	45
<a href="#">ViewPC</a>	View layer of the app. Controls <a href="#">EncryptDialog</a> and ProgressDialog . . . . .	53

## Chapter 5

# File Index

### 5.1 File List

## **Chapter 6**

# **Namespace Documentation**

### **6.1 Ui Namespace Reference**

## Chapter 7

# Class Documentation

### 7.1 AboutPC Class Reference

The [AboutPC](#) class The About Page dialog.

```
#include <aboutpc.h>
```

Inheritance diagram for AboutPC:

Collaboration diagram for AboutPC:

## Public Member Functions

- [AboutPC](#) (QWidget \*parent=0)
- [~AboutPC](#) ()
- void [setVersion](#) (QString version)  
[AboutPC::setVersion](#) Function to set the version display.

### 7.1.1 Detailed Description

The [AboutPC](#) class The About Page dialog.

Definition at line 12 of file [aboutpc.h](#).

### 7.1.2 Constructor & Destructor Documentation

7.1.2.1 [AboutPC::AboutPC](#) ( QWidget \* *parent* = 0 ) [explicit]

Definition at line 4 of file [aboutpc.cpp](#).

7.1.2.2 [AboutPC::~~AboutPC](#) ( )

Definition at line 11 of file [aboutpc.cpp](#).

### 7.1.3 Member Function Documentation

7.1.3.1 void [AboutPC::setVersion](#) ( QString *version* )

[AboutPC::setVersion](#) Function to set the version display.

Parameters

<i>version</i>	Version as QString
----------------	--------------------

Definition at line 19 of file [aboutpc.cpp](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- [aboutpc.h](#)
- [aboutpc.cpp](#)

## 7.2 ControllerPC Class Reference

The [ControllerPC](#) class Controller class, which controls View and Model layers.

```
#include <controllerpc.h>
```

Inheritance diagram for ControllerPC:

Collaboration diagram for ControllerPC:

### Public Slots

- void [abortCircuit](#) ()  
*[ControllerPC::abortCircuit](#) Slot to be called when ProgressDialog in [ViewPC](#) is closed. It flags [ModelPC](#) to stop.*
- void [setJPHSDir](#) (QString dir)  
*[ControllerPC::setJPHSDir](#) Sets JPHS default dir.*

## Public Member Functions

- [ControllerPC](#) ( )

[ControllerPC::ControllerPC](#) Constructor of controller Constructor runs auto-test for [ModelPC](#), creates Model Class ([ModelPC](#)) and View Class ([ViewPC](#)). All signals and slots are connected here.

## Public Attributes

- long int [version](#)

*version* Version of the app

- QString [versionString](#)

*versionString* Version of the app as QString.

### 7.2.1 Detailed Description

The [ControllerPC](#) class Controller class, which controls View and Model layers.

See also

[ViewPC](#), [ModelPC](#)

Definition at line 20 of file [controllerpc.h](#).

### 7.2.2 Constructor & Destructor Documentation

#### 7.2.2.1 ControllerPC::ControllerPC ( )

[ControllerPC::ControllerPC](#) Constructor of controller Constructor runs auto-test for [ModelPC](#), creates Model Class ([ModelPC](#)) and View Class ([ViewPC](#)). All signals and slots are connected here.

Controller class

Note

Version of the app is specified here.

Definition at line 9 of file [controllerpc.cpp](#).

Here is the call graph for this function:

### 7.2.3 Member Function Documentation

#### 7.2.3.1 void ControllerPC::abortCircuit ( ) [slot]

[ControllerPC::abortCircuit](#) Slot to be called when ProgressDialog in [ViewPC](#) is closed. It flags [ModelPC](#) to stop.

Definition at line 37 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

#### 7.2.3.2 void ControllerPC::setJPHSDir ( QString dir ) [slot]

[ControllerPC::setJPHSDir](#) Sets JPHS default dir.

##### Parameters

<i>dir</i>	Directory
------------	-----------

Definition at line 45 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

### 7.2.4 Member Data Documentation

#### 7.2.4.1 long int ControllerPC::version

version Version of the app

Definition at line 28 of file [controllerpc.h](#).

#### 7.2.4.2 QString ControllerPC::versionString

versionString Version of the app as QString.

Definition at line 32 of file [controllerpc.h](#).

The documentation for this class was generated from the following files:

- [controllerpc.h](#)
- [controllerpc.cpp](#)

### 7.3 EncryptDialog Class Reference

The [EncryptDialog](#) class Class to get the image and key to store secret info.

```
#include <encryptdialog.h>
```

Inheritance diagram for EncryptDialog:

Collaboration diagram for EncryptDialog:

## Public Slots

- void [on\\_fileButton\\_clicked](#) ()  
*EncryptDialog::on\_fileButton\_clicked* Slot to select the image.
- void [on\\_buttonBox\\_accepted](#) ()  
*EncryptDialog::on\_buttonBox\_accepted* Slot to start the encryption. Successful closing of the app.
- void [on\\_buttonBox\\_rejected](#) ()  
*EncryptDialog::on\_buttonBox\_rejected* Slot to reject the encryption.
- void [on\\_bitsSlider\\_valueChanged](#) (int value)  
*EncryptDialog::on\_bitsSlider\_valueChanged* Slot if value of the bits slider is changed.

## Public Member Functions

- [EncryptDialog](#) (QByteArray \_data, QWidget \*parent=0)  
*EncryptDialog::EncryptDialog* Constructor of the class. Input data is saved here and some variables are set here.
- [~EncryptDialog](#) ()
- QByteArray [zip](#) ()  
*EncryptDialog::zip* Zipping algorithm It copresses the data and then compresses it using qCompress()

## Public Attributes

- QByteArray [data](#)  
*data* Input data
- bool [success](#)  
*success* Flag, if image was successfully selected and data was encrypted.
- QByteArray [compr\\_data](#)  
*compr\_data* Compressed data, aka Output data.
- QString [inputFileName](#)  
*inputFileName* Filename of the image.
- long long int [size](#)  
*size* Size of the image in square pixels
- QString [key](#)  
*key* Key to be used for encryption in *EncryptDialog::zip*
- bool [goodPercentage](#)  
*goodPercentage* Flag if area of the used data via encryption is less than 70% of the area of the image.
- int [val](#)  
*val* Value of the slider
- int [bitsUsed](#)  
*bitsUsed* Bits used per byte of pixel.
- QImage [image](#)  
*image* Inputted image

### 7.3.1 Detailed Description

The [EncryptDialog](#) class Class to get the image and key to store secret info.

#### Note

Not the most important and well written class.

#### See also

[ViewPC](#)

Definition at line 21 of file [encryptdialog.h](#).

### 7.3.2 Constructor & Destructor Documentation

#### 7.3.2.1 `EncryptDialog::EncryptDialog ( QByteArray _data, QWidget * parent = 0 ) [explicit]`

[EncryptDialog::EncryptDialog](#) Constructor of the class. Input data is saved here and some variables are set here.

Parameters

<code>_data</code>	Input data.
<code>parent</code>	Parent (not in use)

Definition at line 9 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

#### 7.3.2.2 `EncryptDialog::~~EncryptDialog ( )`

Definition at line 26 of file [encryptdialog.cpp](#).

### 7.3.3 Member Function Documentation

#### 7.3.3.1 `void EncryptDialog::on_bitsSlider_valueChanged ( int value ) [slot]`

[EncryptDialog::on\\_bitsSlider\\_valueChanged](#) Slot if value of the bits slider is changed.

Parameters

<code>value</code>	Well, value
--------------------	-------------

Definition at line 107 of file [encryptdialog.cpp](#).

#### 7.3.3.2 `void EncryptDialog::on_buttonBox_accepted ( ) [slot]`

[EncryptDialog::on\\_buttonBox\\_accepted](#) Slot to start the encryption. Successful closing of the app.

Definition at line 82 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

#### 7.3.3.3 void EncryptDialog::on\_buttonBox\_rejected ( ) [slot]

[EncryptDialog::on\\_buttonBox\\_rejected](#) Slot to reject the encryption.

Definition at line 98 of file [encryptdialog.cpp](#).

#### 7.3.3.4 void EncryptDialog::on\_fileButton\_clicked ( ) [slot]

[EncryptDialog::on\\_fileButton\\_clicked](#) Slot to select the image.

Definition at line 57 of file [encryptdialog.cpp](#).

#### 7.3.3.5 QByteArray EncryptDialog::zip ( )

[EncryptDialog::zip](#) Zipping algorithm It copresses the data and then compresses it using qCompress()

Returns

Returns Compressed data.

See also

[ModelPC::unzip](#)

Definition at line 46 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 7.3.4 Member Data Documentation

#### 7.3.4.1 int EncryptDialog::bitsUsed

bitsUsed Bits used per byte of pixel.

See also

[ModelPC::circuit](#)

Definition at line 75 of file [encryptdialog.h](#).

#### 7.3.4.2 QByteArray EncryptDialog::compr\_data

compr\_data Compressed data, aka Output data.

Definition at line 50 of file [encryptdialog.h](#).

#### 7.3.4.3 QByteArray EncryptDialog::data

data Input data

Definition at line 42 of file [encryptdialog.h](#).

#### 7.3.4.4 bool EncryptDialog::goodPercentage

goodPercentage Flag if area of the used data via encryption is less than 70% of the area of the image.

Definition at line 66 of file [encryptdialog.h](#).

#### 7.3.4.5 QImage EncryptDialog::image

image Inputted image

Definition at line 79 of file [encryptdialog.h](#).

#### 7.3.4.6 QString EncryptDialog::inputFileName

inputFileName Filename of the image.

Definition at line 54 of file [encryptdialog.h](#).

#### 7.3.4.7 QString EncryptDialog::key

key Key to be used for encryption in EncryptDialog::zip

Definition at line 62 of file [encryptdialog.h](#).

#### 7.3.4.8 long long int EncryptDialog::size

size Size of the image in square pixels

Definition at line 58 of file [encryptdialog.h](#).

#### 7.3.4.9 bool EncryptDialog::success

success Flag, if image was successfully selected and data was encrypted.

Definition at line 46 of file [encryptdialog.h](#).

#### 7.3.4.10 int EncryptDialog::val

val Value of the slider

Definition at line 70 of file [encryptdialog.h](#).

The documentation for this class was generated from the following files:

- [encryptdialog.h](#)
- [encryptdialog.cpp](#)

## 7.4 ModelPC Class Reference

The [ModelPC](#) class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by [ControllerPC](#).

```
#include <modelpc.h>
```

Inheritance diagram for ModelPC:

Collaboration diagram for ModelPC:

## Public Types

- enum `CryptMode` { `NotDefined`, `v1_3`, `v1_4`, `jphs_mode` }

## Public Slots

- `QImage * encrypt` (`QByteArray data`, `QImage *image`, `int _mode`, `QString key=""`, `int _bitsUsed=8`, `QString *_error=nullptr`)  
*ModelPC::encrypt* Slot to zip and inject data and provide it with some extra stuff After completion start standard  
*ModelPC::inject* Isn't used in PictureCrypt, but used can be used in other - custom projects.
- `QImage * inject` (`QByteArray encr_data`, `QImage *image`, `int _mode`, `int _bitsUsed=8`, `QString *_error=nullptr`)  
*ModelPC::inject* Slot to be called when encrypt mode in *ViewPC* is selected and started.
- `QByteArray decrypt` (`QImage *image`, `QString key`, `int _mode=0`, `QString *_error=nullptr`)  
*ModelPC::decrypt* Slot to be called when decrypt mode in *ViewPC* is selected and started.
- `void fail` (`QString message`)  
*ModelPC::fail* Slot to stop execution of crypton.
- `void alert` (`QString message`, `bool isWarning=false`)  
*ModelPC::alert* Function emits signal *ModelPC::alertView* and calls *ViewPC::alert*.

## Signals

- `void alertView` (`QString messageCode`, `bool isWarning`)  
*alertView* Signal to be called to create *MessageBox*.
- `void saveData` (`QByteArray data`)  
*saveData* Signal to be called to save data from *ModelPC::decrypt*.
- `void saveImage` (`QImage *image`)  
*saveImage* Signal to be called to save image from *ModelPC::encrypt*.
- `void setProgress` (`int val`)  
*setProgress* Signal to be called to set progress of *ProgressDialog*.

## Public Member Functions

- [ModelPC](#) ()  
*ModelPC::ModelPC Constructor Unit tests are run here.*
- QByteArray [unzip](#) (QByteArray data, QByteArray key)  
*ModelPC::unzip Unzip data from [ModelPC::decrypt](#). Just mirrored [EncryptDialog::zip](#).*

## Static Public Member Functions

- static QImage \* [Encrypt](#) (QByteArray data, QImage \*image, int \_mode, QString key="", int \_bitsUsed=8, QString \*\_error=nullptr)
- static QImage \* [Inject](#) (QByteArray encr\_data, QImage \*image, int \_mode, int \_bitsUsed=8, QString \*\_error=nullptr)
- static QByteArray [Decrypt](#) (QImage \*image, QString key, int \_mode=0, QString \*\_error=nullptr)

## Public Attributes

- bool [success](#)  
*success Flag that true by default, but in case of error or cancelling of ProgressDialog it turns to false, which stops execution of [ModelPC::circuit](#)*
- long [version](#)  
*version Version of the class*
- QString [versionString](#)  
*versionString Version as string*
- QString [defaultJPHSDir](#)  
*defaultJPHSDir Default JPHS directory*

## Protected Member Functions

- void [circuit](#) (QImage \*image, QByteArray \*data, long long int countBytes)  
*ModelPC::circuit The brain of the app. Via special circuit stores data in image.*
- void [jphs](#) (QImage \*image, QByteArray \*data)  
*ModelPC::jphs JPHS function to use jphide and jpseek (currently under development)*
- void [processPixel](#) (QPoint pos, QVector< QPoint > \*were, bool isEncrypt)  
*ModelPC::processPixel Processes every pixel. Reads its contains or writes data.*
- void [encryptv1\\_4](#) (QImage \*image, QByteArray data, QString key)  
*ModelPC::encryptv1\_4 Encrypts and injects data to image used in v1.4+.*
- QByteArray [decryptv1\\_3](#) (QImage \*image, QString key)  
*ModelPC::decryptv1\_3 Decrypts data from image in v1.3.*
- QByteArray [decryptv1\\_4](#) (QImage \*image, QString key)  
*ModelPC::decryptv1\_4 Decrypts data from image in v1.4+.*
- void [proccessPixelsv1\\_4](#) (QImage \*image, QByteArray \*data, QByteArray key, bool isEncrypt, QVector< QPair< QPoint, QPair< int, int > > \*were, long long size=-1)  
*ModelPC::proccessPixelsv1\_4 Hides (or retrieves) data to/from pixels.*
- QByteArray [zip](#) (QByteArray data, QByteArray key)  
*ModelPC::zip Zip function, copy of [EncryptDialog::zip](#) Used for [ModelPC](#) in custom projects, other than PictureCrypt.*

## Protected Attributes

- `QString * error`  
*error Current error*

### 7.4.1 Detailed Description

The [ModelPC](#) class Model Layer of the app. Main class that does the work of PictureCrypt logic Controlled by [ControllerPC](#).

#### 7.4.4 Member Function Documentation

7.4.4.1 `void ModelPC::alert ( QString message, bool isWarning = false ) [slot]`

[ModelPC::alert](#) Function emits signal [ModelPC::alertView](#) and calls [ViewPC::alert](#).

Parameters

<i>message</i>	Message to be transmitted.
<i>isWarning</i>	Flag if message is critical.

See also

[ViewPC::alert](#)

Definition at line 940 of file [modelpc.cpp](#).

Here is the caller graph for this function:

#### 7.4.4.2 void ModelPC::alertView ( QString *messageCode*, bool *isWarning* ) [signal]

alertView Signal to be called to create MessageBox.

##### Parameters

<i>messageCode</i>	Message Code to be shown.
<i>isWarning</i>	Flag if message is critical.

See also

[ModelPC::alert](#), [ViewPC::alert](#)

Here is the caller graph for this function:

#### 7.4.4.3 void ModelPC::circuit ( QImage \* *image*, QByteArray \* *data*, long long int *countBytes* ) [protected]

[ModelPC::circuit](#) The brain of the app. Via special circuit stores data in image.

The circuit itself can be found in documentation or in commentaries in source.

## Parameters

<i>image</i>	Image to be processed.
<i>data</i>	Data to be processed.
<i>countBytes</i>	Number of bytes to be read or written.

## See also

[ModelPC::processPixel](#)

Definition at line 359 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.4.4.4 QByteArray ModelPC::Decrypt ( QImage \* image, QString key, int \_mode = 0, QString \* \_error = nullptr ) [static]

Definition at line 34 of file [modelpc.cpp](#).

Here is the call graph for this function:

7.4.4.5 `QByteArray ModelPC::decrypt ( QImage * image, QString key, int _mode = 0, QString * _error = nullptr )`  
[slot]

[ModelPC::decrypt](#) Slot to be called when decrypt mode in [ViewPC](#) is selected and started.

## Parameters

<i>image</i>	Image to be decrypted.
<i>key</i>	Keyphrase with which the data is injected
<i>_mode</i>	Mode for decryption
<i>_error</i>	Error output

## Returns

Returns decrypted data

## See also

[ViewPC::on\\_startButton\\_clicked](#), [ModelPC::inject](#), [ModelPC::circuit](#)

Definition at line 212 of file [modelpc.cpp](#).

Here is the call graph for this function:

#### 7.4.4.6 QByteArray ModelPC::decryptv1\_3 ( QImage \* *image*, QString *key* ) [protected]

[ModelPC::decryptv1\\_3](#) Decrypts data from image in v1.3.

## Parameters

<i>image</i>	Image with data
<i>key</i>	Key

## Returns

Returns obtained data

Definition at line 777 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.4.4.7 QByteArray ModelPC::decryptv1\_4 ( QImage \* *image*, QString *key* ) [protected]

[ModelPC::decryptv1\\_4](#) Decrypts data from image in v1.4+.

##### Parameters

<i>image</i>	Image with data
<i>key</i>	Key

##### Returns

Returns obtained data

Definition at line 602 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.4.4.8** `QImage * ModelPC::Encrypt ( QByteArray data, QImage * image, int _mode, QString key = " ", int _bitsUsed = 8, QString * _error = nullptr ) [static]`

Definition at line 24 of file [modelpc.cpp](#).

Here is the call graph for this function:

**7.4.4.9** `QImage * ModelPC::encrypt ( QByteArray data, QImage * image, int _mode, QString key = " ", int _bitsUsed = 8, QString * _error = nullptr ) [slot]`

[ModelPC::encrypt](#) Slot to zip and inject data and provide it with some extra stuff After completion start standard [ModelPC::inject](#) Isn't used in PictureCrypt, but used can be used in other - custom projects.

#### Parameters

<i>data</i>	Data for embedding
<i>image</i>	Image for embedding
<i>mode</i>	Mode for embedding
<i>key</i>	Key for extra encryption
<i>_bitsUsed</i>	Bits per byte (see <code>ModelPC::bitsUsed</code> )
<i>_error</i>	Error output

#### Returns

Returns image with embedded data

See also

[ModelPC::inject](#)

Definition at line 51 of file [modelpc.cpp](#).

Here is the call graph for this function:

7.4.4.10 `void ModelPC::encryptv1_4 ( QImage * image, QByteArray data, QString key )` [protected]

[ModelPC::encryptv1\\_4](#) Encrypts and injects data to image used in v1.4+.

Parameters

<i>image</i>	Image for injecting
<i>data</i>	Data for embedding

Definition at line 560 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.4.11 void ModelPC::fail ( QString *message* ) [slot]

[ModelPC::fail](#) Slot to stop execution of crypton.

## Parameters

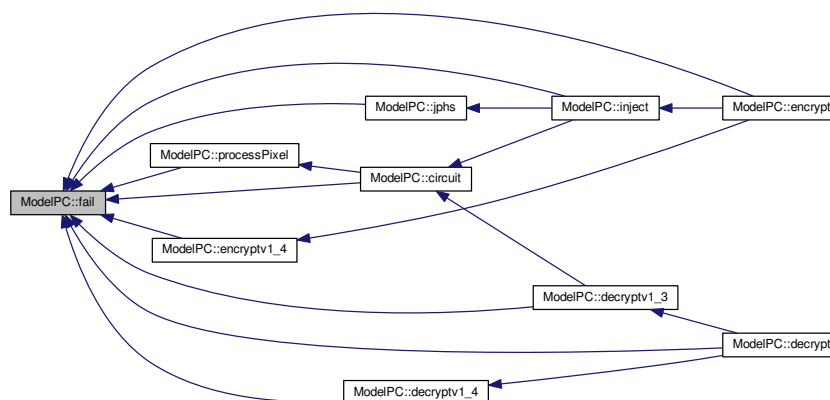

<i>message</i>	Message for user
----------------	------------------

Definition at line 283 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.4.12 QImage \* ModelPC::Inject ( QByteArray *encr\_data*, QImage \* *image*, int *\_mode*, int *\_bitsUsed* = 8, QString \* *\_error* = nullptr ) [static]

Definition at line 29 of file [modelpc.cpp](#).

Here is the call graph for this function:

**7.4.4.13** `QImage * ModelPC::inject ( QByteArray encr_data, QImage * image, int _mode, int _bitsUsed = 8, QString * _error = nullptr ) [slot]`

[ModelPC::inject](#) Slot to be called when encrypt mode in [ViewPC](#) is selected and started.

#### Parameters

<i>encr_data</i>	Data to be inserted to an image.
<i>image</i>	Image to be inserted in.
<i>mode</i>	Mode of encryption
<i>_bitsUsed</i>	Bits per byte used
<i>_error</i>	Error output

#### Returns

Returns image with embedded data.

#### See also

[ViewPC::on\\_startButton\\_clicked](#), [ModelPC::decrypt](#), [ModelPC::circuit](#), [ModelPC::start](#)

Definition at line 139 of file [modelpc.cpp](#).

Here is the caller graph for this function:

**7.4.4.14** `void ModelPC::jphs ( QImage * image, QByteArray * data )` `[protected]`

[ModelPC::jphs](#) JPHS function to use jpshide and jpseek (currently under development)

Parameters

<i>image</i>	Image for embedding
<i>data</i>	Data

Definition at line [298](#) of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.4.4.15** `void ModelPC::processPixelsv1_4 ( QImage * image, QByteArray * data, QByteArray key, bool isEncrypt, QVector< QPair< QPoint, QPair< int, int > > * were, long long size = -1 )` `[protected]`

[ModelPC::processPixelsv1\\_4](#) Hides (or retrieves) data to/from pixels.

## Parameters

<i>image</i>	Original image
<i>data</i>	Data to write (Pointer to empty QByteArray if decrypting)
<i>key</i>	Key
<i>isEncrypt</i>	Mode of Crypton (true -> encryption, false -> decryption)
<i>were</i>	Were vector for visited pixels
<i>size</i>	Size of reading data, unneeded if writing

Definition at line 663 of file [modelpc.cpp](#).

Here is the caller graph for this function:

7.4.4.16 `void ModelPC::processPixel ( QPoint pos, QVector< QPoint > * were, bool isEncrypt )` [protected]

[ModelPC::processPixel](#) Processes every pixel. Reads its contains or writes data.

## Parameters

<i>pos</i>	Position of pixel
<i>were</i>	Vector array containing pixels, that were already processed.
<i>isEncrypt</i>	Mode of operation. If true encryption operations will continue, else the decryption ones.

Definition at line 500 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.4.4.17 void ModelPC::saveData ( QByteArray *data* ) [signal]

saveData Signal to be called to save data from [ModelPC::decrypt](#).

##### Parameters

<i>data</i>	Data to be saved.
-------------	-------------------

Here is the caller graph for this function:

#### 7.4.4.18 void ModelPC::saveImage ( QImage \* *image* ) [signal]

saveImage Signal to be called to save image from [ModelPC::encrypt](#).

##### Parameters

<i>image</i>	Image to be saved.
--------------	--------------------

Here is the caller graph for this function:

#### 7.4.4.19 void ModelPC::setProgress ( int *val* ) [signal]

setProgress Signal to be called to set progress of ProgressDialog.

##### Parameters

<i>val</i>	Value to be set.
------------	------------------

##### See also

[ViewPC::setProgress](#)

Here is the caller graph for this function:

#### 7.4.4.20 QByteArray ModelPC::unzip ( QByteArray *data*, QByteArray *key* )

[ModelPC::unzip](#) Unzip data from [ModelPC::decrypt](#). Just mirrored [EncryptDialog::zip](#).

##### Parameters

<i>data</i>	Data to be decrypted.
<i>key</i>	Key to decrypt the data.

##### Returns

Returns data

##### See also

[EncryptDialog::zip](#), [ModelPC::decrypt](#), [ModelPC::zip](#)

Definition at line 879 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.4.4.21 QByteArray ModelPC::zip ( QByteArray data, QByteArray key ) [protected]

[ModelPC::zip](#) Zip function, copy of [EncryptDialog::zip](#) Used for [ModelPC](#) in custom projects, other than PictureCrypt.

##### Parameters

<i>data</i>	Data to be encrypted
<i>key</i>	Key for encryption

##### Returns

Returns decrypted data

##### See also

[ModelPC::start](#), [ModelPC::inject](#), [ModelPC::unzip](#)

Definition at line 896 of file [modelpc.cpp](#).

*RemovePadding Removes padding.*

### 7.5.1 Detailed Description

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/Qt-AES>.

#### Author

Bricke (Matteo B)

Definition at line 14 of file [qaesencryption.h](#).

### 7.5.2 Member Enumeration Documentation

#### 7.5.2.1 enum [QAESEncryption::Aes](#)

The Aes enum AES Level AES Levels The class supports all AES key lengths.

AES\_128 AES\_192 AES\_256

#### Enumerator

**AES\_128**

**AES\_192**

**AES\_256**

Definition at line 27 of file [qaesencryption.h](#).

## 7.5.2.2 enum QAESEncryption::Mode

The Mode enum AES Mode The class supports the following operating modes ECB CBC CFB OFB.

Enumerator

**ECB**  
**CBC**  
**CFB**  
**OFB**

Definition at line 40 of file [qaesencryption.h](#).

## 7.5.2.3 enum QAESEncryption::Padding

The Padding enum Padding By default the padding method is ISO, however, the class supports:

ZERO PKCS7 ISO

Enumerator

**ZERO**  
**PKCS7**  
**ISO**

Definition at line 55 of file [qaesencryption.h](#).

## 7.5.3 Constructor &amp; Destructor Documentation

## 7.5.3.1 QAESEncryption::QAESEncryption ( QAESEncryption::Aes level, QAESEncryption::Mode mode, QAESEncryption::Padding padding = QAESEncryption::ISO )

Definition at line 67 of file [qaesencryption.cpp](#).

Here is the caller graph for this function:

## 7.5.4 Member Function Documentation

## 7.5.4.1 QByteArray QAESEncryption::Crypt ( QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray &amp; rawText, const QByteArray &amp; key, const QByteArray &amp; iv = NULL, QAESEncryption::Padding padding = QAESEncryption::ISO ) [static]

Crypt Static encode function.

## Parameters

<i>level</i>	AES level of encryption
<i>mode</i>	AES mode
<i>rawText</i>	Input data
<i>key</i>	Key for encryption
<i>iv</i>	IV vector
<i>padding</i>	Padding

## Returns

Returns encrypted data

## See also

[QAESEncryption::encode](#), [QAESEncryption::Decrypt](#)

Definition at line 6 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.5.4.2** `QByteArray QAESEncryption::decode ( const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL )`

`decode` Decodes data with AES

## Note

Basically the non-static method of [QAESEncryption::Decrypt](#)

## Parameters

<i>rawText</i>	Input data
<i>key</i>	Key
<i>iv</i>	IV vector

## Returns

Returns decoded data

## See also

[QAESEncryption::Decrypt](#), [QAESEncryption::encode](#)

Definition at line 441 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.5.4.3** `QByteArray QAESEncryption::Decrypt ( QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL, QAESEncryption::Padding padding = QAESEncryption::ISO ) [static]`

Decrypt Static decode function.

## Parameters

<i>level</i>	AES level of encryption
<i>mode</i>	AES mode
<i>rawText</i>	Encrypted data
<i>key</i>	Key for encrytion
<i>iv</i>	IV vector
<i>padding</i>	Padding

**Returns**

Returns Decrypted data

**See also**

[QAESEncryption::decode](#), [QAESEncryption::Crypt](#)

Definition at line 12 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

**7.5.4.4** `QByteArray QAESEncryption::encode ( const QByteArray & rawText, const QByteArray & key, const QByteArray & iv = NULL )`

encode Encodes data with AES

**Note**

Basically the non-static method of [QAESEncryption::Crypt](#)

**Parameters**

<i>rawText</i>	Input data
<i>key</i>	Key
<i>iv</i>	IV vector

**Returns**

Returns encoded data

**See also**

[QAESEncryption::Crypt](#), [QAESEncryption::decode](#)

Definition at line 391 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

**7.5.4.5** `QByteArray QAESEncryption::ExpandKey ( QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray & key ) [static]`

ExpandKey Expands the key.

Parameters

<i>level</i>	AES level
<i>mode</i>	AES Mode
<i>key</i>	key

Returns

Returns expanded key (I guess)

See also

[QAESEncryption::expandKey](#)

Definition at line 18 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

**7.5.4.6** `QByteArray QAESEncryption::expandKey ( const QByteArray & key )`

ExpandKey Expands the key.

Note

Basically the non-static method of [QAESEncryption::ExpandKey](#)

## Parameters

<i>key</i>	key
------------	-----

## Returns

Returns expanded key (I guess)

## See also

[QAESEncryption::ExpandKey](#)

Definition at line 132 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**7.5.4.7** `QByteArray QAESEncryption::RemovePadding ( const QByteArray & rawText, QAESEncryption::Padding padding ) [static]`

`RemovePadding` Removes padding.

## Parameters

<i>rawText</i>	Input data
<i>padding</i>	Padding

## Returns

Returns data with removed padding (I guess)

See also

[QAESEncryption::removePadding](#)

Definition at line 23 of file [qaesencryption.cpp](#).

#### 7.5.4.8 QByteArray QAESEncryption::removePadding ( const QByteArray & *rawText* )

RemovePadding Removes padding.

Note

Basically the non-static method of [QAESEncryption::RemovePadding](#)

Parameters

<i>rawText</i>	Input data
----------------	------------

Returns

Returns data with removed padding (I guess)

See also

[QAESEncryption::RemovePadding](#)

Definition at line 490 of file [qaesencryption.cpp](#).

The documentation for this class was generated from the following files:

- [qaesencryption.h](#)
- [qaesencryption.cpp](#)

## 7.6 ViewPC Class Reference

The [ViewPC](#) class View layer of the app. Controls [EncryptDialog](#) and ProgressDialog.

```
#include <viewpc.h>
```

Inheritance diagram for ViewPC:

Collaboration diagram for ViewPC:

## Public Slots

- void [alert](#) (QString message, bool isWarning=false)  
*ViewPC::alert* Slot to create `QMessageBox` with message.
- void [saveData](#) (QByteArray Edata)  
*ViewPC::saveData* Slot to be called to save data using `QFileDialog`.
- void [saveImage](#) (QImage \*image)  
*ViewPC::saveImage* Slot to be called to save image using `QFileDialog`.
- void [setProgress](#) (int val)  
*ViewPC::setProgress* Slot to set the value of the `ProgressDialog` (*ViewPC::dialog*).
- void [abortCircuit](#) ()  
*ViewPC::abortCircuit* Slot to close `ProgressDialog` (*ViewPC::dialog*)
- void [setEncryptMode](#) (bool encr)  
*ViewPC::setEncryptMode* Set the encrypt mode (*ViewPC::isEncrypt*)
- void [setVersion](#) (QString version)  
*ViewPC::setVersion* Set the version of the app from *ControllerPC*.

## Signals

- void [encrypt](#) (QByteArray data, QImage \*image, int mode, QString key)  
*encrypt* Signal calling *ModelPC::encrypt*
- void [inject](#) (QByteArray data, QImage \*image, int mode, int bitsUsed)  
*inject* Signal calling *ModelPC::inject*
- void [decrypt](#) (QImage \*\_image, QString key, int mode)  
*decrypt* Signal calling *ModelPC::decrypt*
- void [abortModel](#) ()  
*abortModel* Signal calling to stop *ModelPC::circuit*
- void [setJPHSDir](#) (QString dir)  
*setJPHSPath* Sets the default JPHS directory

## Public Member Functions

- [ViewPC](#) (QWidget \*parent=nullptr)
- [~ViewPC](#) ()  
*ViewPC::~~ViewPC* Simple destructor for this layer.

## Public Attributes

- QProgressDialog \* [dialog](#)  
*dialog ProgressDialog used.*
- bool [progressDialogClosed](#)  
*progressDialogClosed Flag, if dialog is closed.*
- QMap< QString, QString > [errorsDict](#)  
*errorsDict QMap - Errors dictionary*

## Protected Slots

- void [on\\_fileButton\\_clicked](#) ()  
*ViewPC::on\_fileButton\_clicked Slot to be called, when according button is pressed.*
- void [on\\_startButton\\_clicked](#) ()  
*ViewPC::on\_startButton\_clicked Slot to be called, when Start Button is pressed.*
- void [on\\_actionAbout\\_triggered](#) ()  
*ViewPC::on\_actionAbout\_triggered Opens about page.*
- void [on\\_actionHelp\\_triggered](#) ()  
*ViewPC::on\_actionHelp\_triggered Opens online documentation.*
- void [setupErrorsDict](#) ()  
*ViewPC::setupErrorsDict Setups errorsDict from strings.xml.*

## Protected Member Functions

- QString [requestKey](#) ()  
*ViewPC::requestKey Request keyphrase from user using InputDialog.*

### 7.6.1 Detailed Description

The [ViewPC](#) class View layer of the app. Controls [EncryptDialog](#) and ProgressDialog.

See also

[ControllerPC](#), [ModelPC](#), [EncryptDialog](#)

Definition at line 36 of file [viewpc.h](#).

### 7.6.2 Constructor & Destructor Documentation

#### 7.6.2.1 ViewPC::ViewPC ( QWidget \* *parent* = nullptr ) [explicit]

Definition at line 4 of file [viewpc.cpp](#).

Here is the call graph for this function:

### 7.6.2.2 ViewPC::~~ViewPC ( )

[ViewPC::~~ViewPC](#) Simple destructor for this layer.

Definition at line 19 of file [viewpc.cpp](#).

Here is the call graph for this function:

## 7.6.3 Member Function Documentation

### 7.6.3.1 void ViewPC::abortCircuit ( ) [slot]

[ViewPC::abortCircuit](#) Slot to close ProgressDialog ([ViewPC::dialog](#))

Definition at line 218 of file [viewpc.cpp](#).

Here is the caller graph for this function:

### 7.6.3.2 void ViewPC::abortModel ( ) [signal]

`abortModel` Signal calling to stop [ModelPC::circuit](#)

Here is the caller graph for this function:

### 7.6.3.3 void ViewPC::alert ( QString message, bool isWarning = false ) [slot]

[ViewPC::alert](#) Slot to create QMessageBox with message.

## Parameters

<i>message</i>	Message to be shown
<i>isWarning</i>	Flag, if message is critical.

Definition at line 132 of file [viewpc.cpp](#).

Here is the caller graph for this function:

7.6.3.4 `void ViewPC::decrypt ( QImage * _image, QString key, int mode ) [signal]`

decrypt Signal calling [ModelPC::decrypt](#)

## Parameters

<i>_image</i>	Image for decryption
<i>key</i>	encryption key
<i>mode</i>	Mode of decryption

## See also

[ModelPC::decrypt](#), [ModelPC::CryptMode](#)

Here is the caller graph for this function:

7.6.3.5 void ViewPC::encrypt ( QByteArray *data*, QImage \* *image*, int *mode*, QString *key* ) [signal]

encrypt Signal calling [ModelPC::encrypt](#)

#### Parameters

<i>data</i>	Data to write
<i>image</i>	Image to be encrypted into
<i>mode</i>	Mode of encryption
<i>key</i>	Key of encryption

Here is the caller graph for this function:

7.6.3.6 void ViewPC::inject ( QByteArray *data*, QImage \* *image*, int *mode*, int *bitsUsed* ) [signal]

inject Signal calling [ModelPC::inject](#)

#### Parameters

<i>data</i>	Data to write
<i>image</i>	Image to be encrypted into.
<i>mode</i>	Mode of encryption
<i>bitsUsed</i>	Bits used per byte

Here is the caller graph for this function:

7.6.3.7 `void ViewPC::on_actionAbout_triggered ( ) [protected],[slot]`

[ViewPC::on\\_actionAbout\\_triggered](#) Opens about page.

Definition at line 275 of file [viewpc.cpp](#).

Here is the call graph for this function:

7.6.3.8 `void ViewPC::on_actionHelp_triggered ( ) [protected],[slot]`

[ViewPC::on\\_actionHelp\\_triggered](#) Opens online documentation.

Definition at line 285 of file [viewpc.cpp](#).

7.6.3.9 `void ViewPC::on_fileButton_clicked ( ) [protected],[slot]`

[ViewPC::on\\_fileButton\\_clicked](#) Slot to be called, when according button is pressed.

Definition at line 38 of file [viewpc.cpp](#).

7.6.3.10 `void ViewPC::on_startButton_clicked ( ) [protected],[slot]`

[ViewPC::on\\_startButton\\_clicked](#) Slot to be called, when Start Button is pressed.

## 7.6.4 Encrypting

If Encrypting mode is active the data from text browser or from file from file selector will be opened and checked in size.

### Note

File size limit is 16MB

Then the [EncryptDialog](#) opens and image and key is selected. Then the [ViewPC::encrypt](#) signal is called to start [ModelPC::encrypt](#)

### 7.6.5 Decrypting

Else, the image from file selector is transmitted to [ModelPC::decrypt](#)

Definition at line 60 of file [viewpc.cpp](#).

Here is the call graph for this function:

#### 7.6.5.1 QString ViewPC::requestKey ( ) [protected]

[ViewPC::requestKey](#) Request keyphrase from user using InputDialog.

Returns

Returns keyphrase

Definition at line 255 of file [viewpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 7.6.5.2 void ViewPC::saveData ( QByteArray Edata ) [slot]

[ViewPC::saveData](#) Slot to be called to save data using QFileDialog.

## Parameters

<i>Edata</i>	Encrypted data to be saved.
--------------	-----------------------------

## See also

[ModelPC::encrypt](#)

Definition at line 153 of file [viewpc.cpp](#).

Here is the call graph for this function:

### 7.6.5.3 void ViewPC::saveImage ( QImage \* *image* ) [slot]

[ViewPC::saveImage](#) Slot to be called to save image using QFileDialog.

## Parameters

<i>image</i>	Image to be saved.
--------------	--------------------

## See also

[ModelPC::decrypt](#)

Definition at line 174 of file [viewpc.cpp](#).

Here is the call graph for this function:

### 7.6.5.4 void ViewPC::setEncryptMode ( bool *encr* ) [slot]

[ViewPC::setEncryptMode](#) Set the encrpt mode (`ViewPC::isEncrypt`)

## Parameters

<i>encr</i>	= isEncrypt, true if encrypting, false if decrypting
-------------	--

Definition at line 231 of file [viewpc.cpp](#).

Here is the caller graph for this function:

#### 7.6.5.5 void ViewPC::setJPHSDir ( QString *dir* ) [signal]

setJPHSPath Sets the default JPHS directory

## Parameters

<i>dir</i>	Directory
------------	-----------

Here is the caller graph for this function:

#### 7.6.5.6 void ViewPC::setProgress ( int *val* ) [slot]

[ViewPC::setProgress](#) Slot to set the value of the ProgressDialog ([ViewPC::dialog](#)).

## Parameters

<i>val</i>	New value of the dialog. If -1, creates ProgressDialog, if 101 closes the dialog.
------------	---

## See also

[ViewPC::abortCircuit\(\)](#), [ModelPC::setProgress\(\)](#)

Definition at line 192 of file [viewpc.cpp](#).

Here is the call graph for this function:

**7.6.5.7** `void ViewPC::setupErrorsDict ( )` `[protected]`, `[slot]`

[ViewPC::setupErrorsDict](#) Setups errorsDict from strings.xml.

Definition at line 293 of file [viewpc.cpp](#).

Here is the caller graph for this function:

**7.6.5.8** `void ViewPC::setVersion ( QString version )` `[slot]`

[ViewPC::setVersion](#) Set the version of the app from [ControllerPC](#).

Parameters

<i>version</i>	Version as QString
----------------	--------------------

Definition at line 246 of file [viewpc.cpp](#).

Here is the caller graph for this function:

## 7.6.6 Member Data Documentation

### 7.6.6.1 `QProgressDialog*` `ViewPC::dialog`

`dialog` `ProgressDialog` used.

See also

[ViewPC::setProgress](#), [ViewPC::cancel](#), [ModelPC::setProgress](#)

Definition at line 111 of file [viewpc.h](#).

### 7.6.6.2 `QMap<QString, QString>` `ViewPC::errorsDict`

`errorsDict` `QMap` - Errors dictionary

Definition at line 120 of file [viewpc.h](#).

### 7.6.6.3 `bool` `ViewPC::progressDialogClosed`

`progressDialogClosed` Flag, if dialog is closed.

See also

[ViewPC::abortCircuit](#), [ViewPC::setProgress](#)

Definition at line 116 of file [viewpc.h](#).

The documentation for this class was generated from the following files:

- [viewpc.h](#)
- [viewpc.cpp](#)

## Classes

- class [QAESEncryption](#)

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/qt-AES>.
