Chapter 1

PictureCrypt

Project made using QT Creator on C++

1.1 The idea of the project

The idea came to me, when I read an article about steganoraphy. I realised, that you can store data in an image in pixels near the border, so noone can see and even if they did, it is practically impossible to decipher the contents.

1.2 Realisation

To create the encrypted image, you need to select any file for encryption, then using [EncryptDialog](#) you select the image to store the data. Then output image is generated.

Attention

Output image format available is .PNG, because .jpg isn't lossless, so the pixels containing data would be seriously simplified and the data damaged. .BMP isn't used, because noone really uses it and .PNG is just compressed .BMP (more or less)

Note

JPHS support is under development

1.3 How can someone use it?

Well... Anyone who wants to securely communicate. For example your boss watches your inbox, so you do the work and don't chat with your friends about the bar, they've just visited. Using this app you can send them a photo of your desk, saying it's my new working space, but inside the image there is secret message saying "Wanna get another beer tonight? xD". Boss sees this image, but doesn't spot anything. Great example...

1.4 Structure of the project.

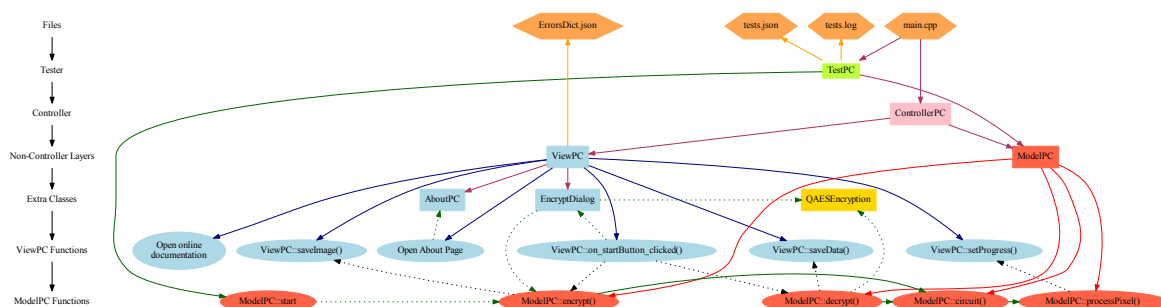

Project is done via MVC Pattern. View and Model layers are totally isolated and run on different threads.

Code from controller.cpp

```
view = new ViewPC();
model = new ModelPC(version);
QThread * modelThread = new QThread();
model->moveToThread(modelThread);
modelThread->start();
```

So when Model is hard-working, View layer is just fine.

Layers also have a ton of functions, so here is a scheme, that I was doing for about 10 hours, which demonstrates the most important functions and classes in the project. And everything is clickable here, so try it out!

Well... I think you didn't quite understand what is happening here... So hop into my "User-friendly" Documentation!

See source on <https://github.com/waleko/PictureCrypt>

Note

`QAESSEncryption` class done by `Bricke`

1.5 External use

`ModelPC` class can be used externally (without UI)

Note

`TestPC` class was introduced recently, its use is advised.

```
#include <modelpc.h>
#include <testpc.h>
#include <QByteArray>
#include <QImage>

...

TestPC testing;
if(!testing.startTest())
    return;
ModelPC * model = new ModelPC();

// Embedding
QImage * resultImage = model->start(QByteArray data, // Data to be embedded
                                   QImage *image, // Image for embedding
                                   int mode = 0, // Mode of embedding
                                   QString key = "", // Key for extra-encryption (if empty, key will be
                                   generated automatically)
                                   int bitsUsed = 8, // Bits per Byte used (better explanation
                                   ModelPC::bitsUsed)
                                   QString *error = nullptr); // Error output, if everything is ok, error
                                   will be "ok"
if(*error != "ok")
    return;
// Note *error is just a code of error (like "muchdata", dictionary of error codes is also available on
// github.

// De-embedding
QByteArray output = model->decrypt(QImage * image, // Image with hidden data
                                  QString *_error = nullptr); // Error output
if(data == output)
    qDebug() << "Great success!";
```

Available methods see here: <https://waleko.github.io/PictureCrypt/#external-use> or here [ModelPC](#)

1.6 JPBS use

The newer versions of the app have jpbs support, but they don't have jpbs built in as it is provided under GNU General Public License v3.0, is "for test purposes only" and is illegal in some countries, so...

Attention

We support JPBS, but we don't use any responsibility for it, we never used or downloaded it, we just used .exe output in the web, and it somehow works by chance. All responsibility for using jpbs is on you, that is why we use made only optionally. That means that to use jpbs with our app you will have to download the jpbs yourself and specify the jpbs directory. However we provide link to the site where you can download the supported version of the jpbs: <http://linux01.gwdg.de/~alatham/stego.html> As it's not our site publishing the dangerous zip file, we just put link to that site (Google does that too, so what? Sue Google?), This text is subject to United Nations' Universal Declaration of Human Rights, (see Article 19 <http://www.un.org/en/universal-declaration-human-rights>):

Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.

And I typed this link randomly, and I'm scared...

Chapter 2

Contributor Covenant Code of Conduct

Our Pledge

In the interest of fostering an open and welcoming environment, we as contributors and maintainers pledge to making participation in our project and our community a harassment-free experience for everyone, regardless of age, body size, disability, ethnicity, gender identity and expression, level of experience, nationality, personal appearance, race, religion, or sexual identity and orientation.

Our Standards

Examples of behavior that contributes to creating a positive environment include:

- Using welcoming and inclusive language
- Being respectful of differing viewpoints and experiences
- Gracefully accepting constructive criticism
- Focusing on what is best for the community
- Showing empathy towards other community members

Examples of unacceptable behavior by participants include:

- The use of sexualized language or imagery and unwelcome sexual attention or advances
- Trolling, insulting/derogatory comments, and personal or political attacks
- Public or private harassment
- Publishing others' private information, such as a physical or electronic address, without explicit permission
- Other conduct which could reasonably be considered inappropriate in a professional setting

Our Responsibilities

Project maintainers are responsible for clarifying the standards of acceptable behavior and are expected to take appropriate and fair corrective action in response to any instances of unacceptable behavior.

Project maintainers have the right and responsibility to remove, edit, or reject comments, commits, code, wiki edits, issues, and other contributions that are not aligned to this Code of Conduct, or to ban temporarily or permanently any contributor for other behaviors that they deem inappropriate, threatening, offensive, or harmful.

Scope

This Code of Conduct applies both within project spaces and in public spaces when an individual is representing the project or its community. Examples of representing a project or community include using an official project e-mail address, posting via an official social media account, or acting as an appointed representative at an online or offline event. Representation of a project may be further defined and clarified by project maintainers.

Enforcement

Instances of abusive, harassing, or otherwise unacceptable behavior may be reported by contacting the project team at a.kovrigin0@gmail.com. The project team will review and investigate all complaints, and will respond in a way that it deems appropriate to the circumstances. The project team is obligated to maintain confidentiality with regard to the reporter of an incident. Further details of specific enforcement policies may be posted separately.

Project maintainers who do not follow or enforce the Code of Conduct in good faith may face temporary or permanent repercussions as determined by other members of the project's leadership.

Attribution

This Code of Conduct is adapted from the [Contributor Covenant](http://contributor-covenant.org/version/1/4), version 1.4, available at <http://contributor-covenant.org/version/1/4>

Chapter 3

PictureCrypt

Make your pictures crypted.

About

Project is made only using QT. [QAESEncryption](#) by bricke was also used. MVC pattern used. PictureCrypt project is UI based, the model contains all business logic and can work as standalone class.

External use

[ModelPC](#) class can be used externally (without UI)

```
#include <modelpc.h>
#include <QByteArray>
#include <QImage>

...

ModelPC * model = new ModelPC(ver);
// ver is version of the app, used to check the data structure version
// ver is type long and is calculated as if version is "x.y.z" => ver = x * 65536 + y * 256 + z
// Default parameter is 2^17 (2.0.0)

// Connecting signals

// Essential ones

model->saveData(QByteArray data)
// Used to return the retrieved data

model->saveImage(QImage * image)
// Used to return the modified image

// Extra ones

model->alertView(QString message, bool isWarning)
// Used for messages to be shown to users

model->setProgress(int val)
// Used to show user the progress of embedding
// -1 indicates the creation of some kind of progress dialog
// from 0 to 100 shows the progress
// 101 indicates that progress dialog should be closed
```

Available methods

Essential ones

start

Used for embedding

Parameters: data Data to be encrypted _image Image to be encrypted into. _bitsUsed Bits per byte, see also [ModelPC::bitsUsed](#) key Key, if default (empty), random key of 64 characters will be generated. mode Mode of encryption

```
model->start(QByteArray data, QImage image, int mode = 0, QString key = "", int _bitsUsed = 8);
```

decrypt

Used for de-embedding

Parameters: image Image to be decrypted.

```
model->decrypt(QImage * image);
```

Extra ones

encrypt

Used for embedding but with data already packed with stuff like version, file size, aes key, etc. Used in PictureCrypt project

Parameters:

encr_data Data to be embbed to an image. image Image to be embbed into. mode Mode of encryption

```
model->encrypt(QByteArray encr_data, QImage * image, int mode = 0);
```

fail

Used for stopping the embedding or de-embedding proccess Parameters:

message Message for user

```
model->fail(QString message);
```

Available modes of embedding

- 0 - Standard, created by me
- 1 - JPHS, requires manually installed JPHS and specified directory (not currently available).

Documentation

Doxygen Documentation available [here](#)

Dependencies

- qtcore
- [QAESEncryption](#) by bricke

Chapter 4

Namespace Index

4.1 Namespace List

Here is a list of all namespaces with brief descriptions:

ErrorsDictSetup	19
tests-setup	21
Ui	23

Chapter 5

Hierarchical Index

5.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

QDialog	
AboutPC	25
EncryptDialog	31
QMainWindow	
ViewPC	66
QObject	
ControllerPC	27
ModelPC	38
QAESEncryption	53
TestPC	62

Chapter 6

Class Index

6.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

AboutPC		
	The About Page dialog	25
ControllerPC		
	The ControllerPC class Controller class, which controls View and Model layers	27
EncryptDialog		
	Class to get the image and key to store secret info	31
ModelPC		
	The ModelPC class Model Layer of the app. Controlled by ControllerPC	38
QAESEncryption		
	Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: https://github.com/bricke/Qt-AES	53
TestPC		
	AutoTest for ModelPC Currently used in main.cpp	62
ViewPC		
	View layer of the app. Controls EncryptDialog and ProgressDialog	66

Chapter 7

8.2.1.2 `bitsUsed`

```
tests-setup.bitsUsed
```

Definition at line 18 of file [tests-setup.py](#).

8.2.1.3 `data`

```
tests-setup.data
```

Definition at line 18 of file [tests-setup.py](#).

8.2.1.4 expect

`tests-setup.expect`

Definition at line 18 of file [tests-setup.py](#).

8.2.1.5 f

`tests-setup.f`

Definition at line 26 of file [tests-setup.py](#).

8.2.1.6 filename

`string tests-setup.filename = 'tests.json'`

Definition at line 2 of file [tests-setup.py](#).

8.2.1.7 image

`tests-setup.image`

Definition at line 18 of file [tests-setup.py](#).

8.2.1.8 indent

`tests-setup.indent`

Definition at line 26 of file [tests-setup.py](#).

8.2.1.9 input_data

`tests-setup.input_data = input()`

Definition at line 14 of file [tests-setup.py](#).

8.2.1.10 js

```
tests-setup.js = json.load(raw)
```

Definition at line 6 of file [tests-setup.py](#).

8.2.1.11 key

```
tests-setup.key
```

Definition at line 18 of file [tests-setup.py](#).

8.2.1.12 mode

```
tests-setup.mode
```

Definition at line 18 of file [tests-setup.py](#).

8.2.1.13 obj

```
dictionary tests-setup.obj = {'data':data, 'image':image, 'expectation':expect, 'mode':int(mode), 'key':↵  
:key, 'bitsUsed':int(bitsUsed)}
```

Definition at line 20 of file [tests-setup.py](#).

8.2.1.14 raw

```
tests-setup.raw = open(filename, 'r')
```

Definition at line 4 of file [tests-setup.py](#).

8.2.1.15 sep

```
tests-setup.sep
```

Definition at line 9 of file [tests-setup.py](#).

8.3 Ui Namespace Reference

Chapter 9

Class Documentation

9.1 AboutPC Class Reference

The [AboutPC](#) class The About Page dialog.

```
#include <aboutpc.h>
```

Inheritance diagram for AboutPC:

Collaboration diagram for AboutPC:

Public Member Functions

- [AboutPC](#) (QWidget *parent=0)
- [~AboutPC](#) ()
- void [setVersion](#) (QString version)
[AboutPC::setVersion](#) Function to set the version display.

9.1.1 Detailed Description

The [AboutPC](#) class The About Page dialog.

Definition at line 12 of file [aboutpc.h](#).

9.1.2 Constructor & Destructor Documentation

9.1.2.1 AboutPC()

```
AboutPC::AboutPC (
    QWidget * parent = 0 ) [explicit]
```

Definition at line 4 of file [aboutpc.cpp](#).

9.1.2.2 ~AboutPC()

```
AboutPC::~AboutPC ( )
```

Definition at line 11 of file [aboutpc.cpp](#).

9.1.3 Member Function Documentation

9.1.3.1 setVersion()

```
void AboutPC::setVersion (
    QString version )
```

[AboutPC::setVersion](#) Function to set the version display.

Parameters

<i>version</i>	Version as QString
----------------	--------------------

Definition at line 19 of file [aboutpc.cpp](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- `C:/Users/salex/Documents/GitHub/PictureCrypt/aboutpc.h`
- `C:/Users/salex/Documents/GitHub/PictureCrypt/aboutpc.cpp`

9.2 ControllerPC Class Reference

The [ControllerPC](#) class Controller class, which controls View and Model layers.

```
#include <controllerpc.h>
```

Inheritance diagram for ControllerPC:

Collaboration diagram for ControllerPC:

Public Slots

- void [abortCircuit](#) ()
[ControllerPC::abortCircuit](#) Slot to be called when ProgressDialog in [ViewPC](#) is closed. It flags [ModelPC](#) to stop.
- void [setBitsUsed](#) (int bitsUsed)
[ControllerPC::setBitsUsed](#) Slot to set [ModelPC::bitsUsed](#).
- void [setJPHSDir](#) (QString dir)
[ControllerPC::setJPHSDir](#) Sets JPHS default dir.

Public Member Functions

- [ControllerPC](#) ()
[ControllerPC::ControllerPC](#) Constructor of controller Constructor runs auto-test for [ModelPC](#), creates Model Class ([ModelPC](#)) and View Class ([ViewPC](#)). All signals and slots are connected here.

Public Attributes

- long int [version](#)
version Version of the app
- QString [versionString](#)
versionString Version of the app as QString.

9.2.1 Detailed Description

The [ControllerPC](#) class Controller class, which controls View and Model layers.

See also

[ViewPC](#), [ModelPC](#)

Definition at line 19 of file [controllerpc.h](#).

9.2.2 Constructor & Destructor Documentation

9.2.2.1 ControllerPC()

```
ControllerPC::ControllerPC ( )
```

ControllerPC::ControllerPC Constructor of controller Constructor runs auto-test for [ModelIPC](#), creates Model Class ([ModelIPC](#)) and View Class ([ViewPC](#)). All signals and slots are connected here.

Controller class

Note

Version of the app is specified here.

Definition at line 9 of file [controllerpc.cpp](#).

Here is the call graph for this function:

9.2.3 Member Function Documentation

9.2.3.1 abortCircuit

```
void ControllerPC::abortCircuit ( ) [slot]
```

ControllerPC::abortCircuit Slot to be called when ProgressDialog in [ViewPC](#) is closed. It flags [ModelIPC](#) to stop.

Definition at line 36 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

9.2.3.2 setBitsUsed

```
void ControllerPC::setBitsUsed (
    int bitsUsed ) [slot]
```

ControllerPC::setBitsUsed Slot to set [ModelIPC::bitsUsed](#).

Parameters

<i>bitsUsed</i>	Value
-----------------	-------

Definition at line 44 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

9.2.3.3 setJPHSDir

```
void ControllerPC::setJPHSDir (  
    QString dir ) [slot]
```

[ControllerPC::setJPHSDir](#) Sets JPHS default dir.

Parameters

<i>dir</i>	Directory
------------	-----------

Definition at line 52 of file [controllerpc.cpp](#).

Here is the caller graph for this function:

9.2.4 Member Data Documentation

9.2.4.1 version

```
long int ControllerPC::version
```

version Version of the app

Definition at line 27 of file [controllerpc.h](#).

9.2.4.2 versionString

```
QString ControllerPC::versionString
```

versionString Version of the app as QString.

Definition at line 31 of file [controllerpc.h](#).

The documentation for this class was generated from the following files:

- C:/Users/salex/Documents/GitHub/PictureCrypt/[controllerpc.h](#)
- C:/Users/salex/Documents/GitHub/PictureCrypt/[controllerpc.cpp](#)

9.3 EncryptDialog Class Reference

The [EncryptDialog](#) class Class to get the image and key to store secret info.

```
#include <encryptdialog.h>
```

Inheritance diagram for EncryptDialog:

Collaboration diagram for EncryptDialog:

Public Slots

- void [on_fileButton_clicked](#) ()
EncryptDialog::on_fileButton_clicked Slot to select the image.
- void [on_buttonBox_accepted](#) ()
EncryptDialog::on_buttonBox_accepted Slot to start the encryption. Successful closing of the app.
- void [on_buttonBox_rejected](#) ()
EncryptDialog::on_buttonBox_rejected Slot to reject the encryption.
- void [on_horizontalSlider_valueChanged](#) (int value)
EncryptDialog::on_horizontalSlider_valueChanged Slot if value of the slider is changed. Key is generated here.

Public Member Functions

- [EncryptDialog](#) (QByteArray _data, QWidget *parent=0)
EncryptDialog::EncryptDialog Constructor of the class. Input data is saved here and some variables are set here.
- [~EncryptDialog](#) ()
- QByteArray [zip](#) ()
EncryptDialog::zip Zipping algorithm It copresses the data and then compresses it using qCompress()

Public Attributes

- QByteArray [data](#)
data Input data
- bool [success](#)
success Flag, if image was successfully selected and data was encrypted.
- QByteArray [compr_data](#)
compr_data Compressed data, aka Output data.
- QString [inputFileName](#)
inputFileName Filename of the image.
- long long int [size](#)
size Size of the image in square pixels
- QString [key](#)
key Key to be used for encryption in *EncryptDialog::zip*
- bool [goodPercentage](#)
goodPercentage Flag if area of the used data via encryption is less than 70% of the area of the image.
- int [val](#)
val Value of the slider
- int [bitsUsed](#)
bitsUsed Bits used per byte of pixel.
- QImage [image](#)
image Inputted image

9.3.1 Detailed Description

The [EncryptDialog](#) class Class to get the image and key to store secret info.

Note

Not the most important and well written class.

See also

[ViewPC](#)

Definition at line 21 of file [encryptdialog.h](#).

9.3.2 Constructor & Destructor Documentation

9.3.2.1 EncryptDialog()

```
EncryptDialog::EncryptDialog (
    QByteArray _data,
    QWidget * parent = 0 ) [explicit]
```

[EncryptDialog::EncryptDialog](#) Constructor of the class. Input data is saved here and some variables are set here.

Parameters

<i>_data</i>	Input data.
<i>parent</i>	Parent (not in use)

Definition at line 9 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

9.3.2.2 ~EncryptDialog()

```
EncryptDialog::~EncryptDialog ( )
```

Definition at line 29 of file [encryptdialog.cpp](#).

9.3.3 Member Function Documentation

9.3.3.1 on_buttonBox_accepted

```
void EncryptDialog::on_buttonBox_accepted ( ) [slot]
```

[EncryptDialog::on_buttonBox_accepted](#) Slot to start the encryption. Successful closing of the app.

Definition at line 85 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

9.3.3.2 on_buttonBox_rejected

```
void EncryptDialog::on_buttonBox_rejected ( ) [slot]
```

[EncryptDialog::on_buttonBox_rejected](#) Slot to reject the encryption.

Definition at line 100 of file [encryptdialog.cpp](#).

9.3.3.3 on_fileButton_clicked

```
void EncryptDialog::on_fileButton_clicked ( ) [slot]
```

[EncryptDialog::on_fileButton_clicked](#) Slot to select the image.

Definition at line 60 of file [encryptdialog.cpp](#).

9.3.3.4 on_horizontalSlider_valueChanged

```
void EncryptDialog::on_horizontalSlider_valueChanged (
    int value ) [slot]
```

[EncryptDialog::on_horizontalSlider_valueChanged](#) Slot if value of the slider is changed. Key is generated here.

Parameters

<i>value</i>	Value of the slider.
--------------	----------------------

Definition at line 110 of file [encryptdialog.cpp](#).

9.3.3.5 zip()

```
QByteArray EncryptDialog::zip ( )
```

[EncryptDialog::zip](#) Zipping algorithm It copresses the data and then compresses it using qCompress()

Returns

Returns Compressed data.

See also

[ModelPC::unzip](#)

Definition at line 49 of file [encryptdialog.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.3.4 Member Data Documentation

9.3.4.1 bitsUsed

```
int EncryptDialog::bitsUsed
```

bitsUsed Bits used per byte of pixel.

See also

[ModelPC::circuit](#)

Definition at line 75 of file [encryptdialog.h](#).

9.3.4.2 compr_data

`QByteArray EncryptDialog::compr_data`

`compr_data` Compressed data, aka Output data.

Definition at line 50 of file [encryptdialog.h](#).

9.3.4.3 data

`QByteArray EncryptDialog::data`

`data` Input data

Definition at line 42 of file [encryptdialog.h](#).

9.3.4.4 goodPercentage

`bool EncryptDialog::goodPercentage`

`goodPercentage` Flag if area of the used data via encryption is less than 70% of the area of the image.

Definition at line 66 of file [encryptdialog.h](#).

9.3.4.5 image

`QImage EncryptDialog::image`

`image` Inputted image

Definition at line 79 of file [encryptdialog.h](#).

9.3.4.6 inputFileName

`QString EncryptDialog::inputFileName`

`inputFileName` Filename of the image.

Definition at line 54 of file [encryptdialog.h](#).

9.3.4.7 key

```
QString EncryptDialog::key
```

key Key to be used for encryption in EncryptDialog::zip

Definition at line 62 of file [encryptdialog.h](#).

9.3.4.8 size

```
long long int EncryptDialog::size
```

size Size of the image in square pixels

Definition at line 58 of file [encryptdialog.h](#).

9.3.4.9 success

```
bool EncryptDialog::success
```

success Flag, if image was successfully selected and data was encrypted.

Definition at line 46 of file [encryptdialog.h](#).

9.3.4.10 val

```
int EncryptDialog::val
```

val Value of the slider

Definition at line 70 of file [encryptdialog.h](#).

The documentation for this class was generated from the following files:

- C:/Users/salex/Documents/GitHub/PictureCrypt/[encryptdialog.h](#)
- C:/Users/salex/Documents/GitHub/PictureCrypt/[encryptdialog.cpp](#)

9.4 ModelPC Class Reference

The [ModelPC](#) class Model Layer of the app. Controlled by [ControllerPC](#).

```
#include <modelpc.h>
```

Inheritance diagram for ModelPC:

Collaboration diagram for ModelPC:

Public Slots

- QImage * [start](#) (QByteArray data, QImage *image, int mode=0, QString key="", int _bitsUsed=8, QString *_error=nullptr)
[ModelPC::start](#) Slot to zip and encrypt data and provide it with some extra stuff After completion start standard [ModelPC::encrypt](#) Isn't used in PictureCrypt, but used can be used in other - custom projects.
- QImage * [encrypt](#) (QByteArray encr_data, QImage *image, int mode=0, QString *_error=nullptr)
[ModelPC::encrypt](#) Slot to be called when encrypt mode in [ViewPC](#) is selected and started.
- QByteArray [decrypt](#) (QImage *image, QString *_error=nullptr)
[ModelPC::decrypt](#) Slot to be called when decrypt mode in [ViewPC](#) is selected and started.
- void [fail](#) (QString message)
[ModelPC::fail](#) Slot to stop execution of crypton.

Signals

- [alertView](#) (QString messageCode, bool isWarning)
alertView Signal to be called to create MessageBox.
- [saveData](#) (QByteArray data)
saveData Signal to be called to save data from [ModelPC::decrypt](#).
- [saveImage](#) (QImage *image)
saveImage Signal to be called to save image from [ModelPC::encrypt](#).
- [setProgress](#) (int val)
setProgress Signal to be called to set progress of ProgressDialog.

Public Member Functions

- [ModelPC](#) ()
[ModelPC::ModelPC](#) Constructor Unit tests are run here.
- QByteArray [unzip](#) (QByteArray data, QByteArray key)
[ModelPC::unzip](#) Unzip data from [ModelPC::decrypt](#). Just mirrored [EncryptDialog::zip](#).
- void [alert](#) (QString message, bool isWarning=false)
[ModelPC::alert](#) Function emits signal [ModelPC::alertView](#) and calls [ViewPC::alert](#).

Public Attributes

- bool [success](#)
success Flag that true by default, but in case of error or cancelling of ProgressDialog it turns to false, which stops execution of [ModelPC::circuit](#)
- long [version](#)
version Version of the class
- QString [versionString](#)
versionString Version as string
- int [curMode](#)
curMode Mode of en- or decryption
- int [bitsUsed](#)
bitsUsed Bits per byte used in pixel
- QString [defaultJPHSDir](#)
defaultJPHSDir Default JPHS directory
- QString * [error](#)
error Current error

Protected Member Functions

- void [circuit](#) (QImage *image, QByteArray *data, long long int countBytes)
[ModelPC::circuit](#) The brain of the app. Via special circuit stores data in image.
- void [jphs](#) (QImage *image, QByteArray *data)
[ModelPC::jphs](#) JPHS function to use jphide and jpseek (currently under development)
- void [processPixel](#) (QPoint pos, QVector< QPoint > *were, bool isEncrypt)
[ModelPC::processPixel](#) Processes every pixel. Reads its contains or writes data.
- QByteArray [zip](#) (QByteArray data, QByteArray key)
[ModelPC::zip](#) Zip function, copy of [EncryptDialog::zip](#) Used for [ModelPC](#) in custom projects, other than PictureCrypt.

9.4.1 Detailed Description

The [ModelPC](#) class Model Layer of the app. Controled by [ControllerPC](#).

See also

[ViewPC](#), [ControllerPC](#)

Definition at line 27 of file [modelpc.h](#).

9.4.2 Constructor & Destructor Documentation

9.4.2.1 ModelPC()

```
ModelPC::ModelPC ( )
```

[ModelPC::ModelPC](#) Constructor Unit tests are run here.

See also

[ControllerPC](#), [ViewPC](#)

Definition at line 8 of file [modelpc.cpp](#).

9.4.3 Member Function Documentation

9.4.3.1 alert()

```
void ModelPC::alert (
    QString message,
    bool isWarning = false )
```

[ModelPC::alert](#) Function emits signal [ModelPC::alertView](#) and calls [ViewPC::alert](#).

Parameters

<i>message</i>	Message to be transmitted.
<i>isWarning</i>	Flag if message is critical.

See also

[ViewPC::alert](#)

Definition at line 586 of file [modelpc.cpp](#).

Here is the caller graph for this function:

9.4.3.2 alertView

```

ModelPC::alertView (
    QString messageCode,
    bool isWarning ) [signal]
  
```

alertView Signal to be called to create MessageBox.

Parameters

<i>messageCode</i>	Message Code to be shown.
<i>isWarning</i>	Flag if message is critical.

See also

[ModelPC::alert](#), [ViewPC::alert](#)

Here is the caller graph for this function:

9.4.3.3 circuit()

```

void ModelPC::circuit (
    QImage * image,
    QByteArray * data,
    long long int countBytes ) [protected]
  
```

[ModelPC::circuit](#) The brain of the app. Via special circuit stores data in image.

The circuit itself can be found in documentation or in commentaries in source.

Parameters

<i>image</i>	Image to be processed.
<i>data</i>	Data to be processed.
<i>countBytes</i>	Number of bytes to be read or written.

See also

[ModelPC::processPixel](#)

Definition at line 290 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.4.3.4 decrypt

```

QByteArray ModelPC::decrypt (
    QImage * image,
    QString * _error = nullptr ) [slot]

```

[ModelPC::decrypt](#) Slot to be called when decrypt mode in [ViewPC](#) is selected and started.

Parameters

<i>image</i>	Image to be decrypted.
--------------	------------------------

Returns

Returns decrypted data

Parameters

<code>_error</code>	Error output
---------------------	--------------

See also

[ViewPC::on_startButton_clicked](#), [ModelPC::encrypt](#), [ModelPC::circuit](#)

Definition at line 140 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.4.3.5 encrypt

```

QImage * ModelPC::encrypt (
    QByteArray encr_data,
    QImage * image,
    int mode = 0,
    QString * _error = nullptr ) [slot]

```

[ModelPC::encrypt](#) Slot to be called when encrypt mode in [ViewPC](#) is selected and started.

Parameters

<code>encr_data</code>	Data to be inserted to an image.
<code>image</code>	Image to be inserted in.
<code>mode</code>	Mode of encryption
<code>_error</code>	Error output

Returns

Returns image with embedded data.

See also

[ViewPC::on_startButton_clicked](#), [ModelPC::decrypt](#), [ModelPC::circuit](#)

Definition at line 90 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.4.3.6 fail**

```
void ModelPC::fail (
    QString message ) [slot]
```

[ModelPC::fail](#) Slot to stop execution of crypton.

Parameters

<i>message</i>	Message for user
----------------	------------------

Definition at line 217 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.4.3.7 jphs()

```

void ModelPC::jphs (
    QImage * image,
    QByteArray * data ) [protected]
  
```

[ModelPC::jphs](#) JPHS function to use jphide and jpseek (currently under development)

Parameters

<i>image</i>	Image for embedding
<i>data</i>	Data

Definition at line 229 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.4.3.8 processPixel()

```

void ModelPC::processPixel (
    QPoint pos,
    QVector< QPoint > * were,
    bool isEncrypt ) [protected]
  
```

[ModelPC::processPixel](#) Processes every pixel. Reads its contains or writes data.

Parameters

<i>pos</i>	Position of pixel
<i>were</i>	Vector array containing pixels, that were already processed.
<i>isEncrypt</i>	Mode of operation. If true encryption operations will continue, else the decryption ones.

Definition at line [432](#) of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.4.3.9 saveData

```
ModelPC::saveData (
    QByteArray data ) [signal]
```

saveData Signal to be called to save data from [ModelPC::decrypt](#).

Parameters

<i>data</i>	Data to be saved.
-------------	-------------------

Here is the caller graph for this function:

9.4.3.10 saveImage

```
ModelPC::saveImage (
    QImage * image ) [signal]
```

saveImage Signal to be called to save image from [ModelPC::encrypt](#).

Parameters

<i>image</i>	Image to be saved.
--------------	--------------------

Here is the caller graph for this function:

9.4.3.11 setProgress

```
ModelPC::setProgress (
    int val ) [signal]
```

setProgress Signal to be called to set progress of ProgressDialog.

Parameters

<i>val</i>	Value to be set.
------------	------------------

See also

[ViewPC::setProgress](#)

Here is the caller graph for this function:

9.4.3.12 start

```

 QImage * ModelPC::start (
     QByteArray data,
     QImage * image,
     int mode = 0,
     QString key = "",
     int _bitsUsed = 8,
     QString * _error = nullptr ) [slot]
 
```

[ModelPC::start](#) Slot to zip and encrypt data and provide it with some extra stuff After completion start standard [ModelPC::encrypt](#) Isn't used in PictureCrypt, but used can be used in other - custom projects.

Parameters

<i>data</i>	Data for embedding
<i>image</i>	Image for embedding
<i>mode</i>	Mode for embedding
<i>key</i>	Key for extra encryption (if empty, key will be auto-generated)
<i>_bitsUsed</i>	Bits per byte (see ModelPC::bitsUsed)
<i>_error</i>	Error output

Returns

Returns image with embedded data

Definition at line 34 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.4.3.13 unzip()

```

QByteArray ModelPC::unzip (
    QByteArray data,
    QByteArray key )

```

[ModelPC::unzip](#) Unzip data from [ModelPC::decrypt](#). Just mirrored [EncryptDialog::zip](#).

Parameters

<i>data</i>	Data to be decrypted.
<i>key</i>	Key to decrypt the data.

Returns

Returns data

See also

[EncryptDialog::zip](#), [ModelPC::decrypt](#), [ModelPC::zip](#)

Definition at line 525 of file [modelpc.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.4.3.14 zip()

```

QByteArray ModelPC::zip (
    QByteArray data,
    QByteArray key ) [protected]
  
```

[ModelPC::zip](#) Zip function, copy of [EncryptDialog::zip](#) Used for [ModelPC](#) in custom projects, other than PictureCrypt.

Parameters

<i>data</i>	Data to be encrypted
<i>key</i>	Key for encryption

Returns

Returns decrypted data

See also

9.5 QAESEncryption Class Reference

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/Qt-AES>.

```
#include <qaesencryption.h>
```

Inheritance diagram for QAESEncryption:

Collaboration diagram for QAESEncryption:

Public Types

- enum [Aes](#) { [AES_128](#), [AES_192](#), [AES_256](#) }

The Aes enum AES Level AES Levels The class supports all AES key lengths.

- enum [Mode](#) { [ECB](#), [CBC](#), [CFB](#), [OFB](#) }

The Mode enum AES Mode The class supports the following operating modes ECB CBC CFB OFB.

- enum [Padding](#) { [ZERO](#), [PKCS7](#), [ISO](#) }

The Padding enum Padding By default the padding method is ISO, however, the class supports:

Public Member Functions

- [QAESEncryption](#) ([QAESEncryption::Aes](#) level, [QAESEncryption::Mode](#) mode, [QAESEncryption::Padding](#) padding=[QAESEncryption::ISO](#))
- [QByteArray encode](#) (const [QByteArray](#) &rawText, const [QByteArray](#) &key, const [QByteArray](#) &iv=NULL)
encode Encodes data with AES
- [QByteArray decode](#) (const [QByteArray](#) &rawText, const [QByteArray](#) &key, const [QByteArray](#) &iv=NULL)
decode Decodes data with AES
- [QByteArray removePadding](#) (const [QByteArray](#) &rawText)
RemovePadding Removes padding.
- [QByteArray expandKey](#) (const [QByteArray](#) &key)
ExpandKey Expands the key.

Static Public Member Functions

- static [QByteArray Crypt](#) ([QAESEncryption::Aes](#) level, [QAESEncryption::Mode](#) mode, const [QByteArray](#) &rawText, const [QByteArray](#) &key, const [QByteArray](#) &iv=NULL, [QAESEncryption::Padding](#) padding=[QAESEncryption::ISO](#))
Crypt Static encode function.
- static [QByteArray Decrypt](#) ([QAESEncryption::Aes](#) level, [QAESEncryption::Mode](#) mode, const [QByteArray](#) &rawText, const [QByteArray](#) &key, const [QByteArray](#) &iv=NULL, [QAESEncryption::Padding](#) padding=[QAESEncryption::ISO](#))
Decrypt Static decode function.
- static [QByteArray ExpandKey](#) ([QAESEncryption::Aes](#) level, [QAESEncryption::Mode](#) mode, const [QByteArray](#) &key)
ExpandKey Expands the key.
- static [QByteArray RemovePadding](#) (const [QByteArray](#) &rawText, [QAESEncryption::Padding](#) padding)
RemovePadding Removes padding.

9.5.1 Detailed Description

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/Qt-AES>.

Author

Bricke (Matteo B)

Definition at line 14 of file [qaesencryption.h](#).

9.5.2 Member Enumeration Documentation

9.5.2.1 Aes

enum [QAESEncryption::Aes](#)

The Aes enum AES Level AES Levels The class supports all AES key lengths.

AES_128 AES_192 AES_256

Enumerator

AES_128	
AES_192	
AES_256	

Definition at line 27 of file [qaesencryption.h](#).

9.5.2.2 Mode

enum [QAESEncryption::Mode](#)

The Mode enum AES Mode The class supports the following operating modes ECB CBC CFB OFB.

Enumerator

ECB	
CBC	
CFB	
OFB	

Definition at line 40 of file [qaesencryption.h](#).

9.5.2.3 Padding

enum [QAESEncryption::Padding](#)

The Padding enum Padding By default the padding method is ISO, however, the class supports:

ZERO PKCS7 ISO

Enumerator

ZERO	
PKCS7	
ISO	

Definition at line 55 of file [qaesencryption.h](#).

9.5.3 Constructor & Destructor Documentation

9.5.3.1 QAESEncryption()

```
QAESEncryption::QAESEncryption (
    QAESEncryption::Aes level,
    QAESEncryption::Mode mode,
    QAESEncryption::Padding padding = QAESEncryption::ISO )
```

Definition at line 67 of file [qaesencryption.cpp](#).

Here is the caller graph for this function:

9.5.4 Member Function Documentation

9.5.4.1 Crypt()

```
QByteArray QAESEncryption::Crypt (
    QAESEncryption::Aes level,
    QAESEncryption::Mode mode,
    const QByteArray & rawText,
    const QByteArray & key,
    const QByteArray & iv = NULL,
    QAESEncryption::Padding padding = QAESEncryption::ISO ) [static]
```

Crypt Static encode function.

Parameters

<i>level</i>	AES level of encryption
<i>mode</i>	AES mode
<i>rawText</i>	Input data
<i>key</i>	Key for encryption
<i>iv</i>	IV vector
<i>padding</i>	Padding

Returns

Returns encrypted data

See also

[QAESEncryption::encode](#), [QAESEncryption::Decrypt](#)

Definition at line 6 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

9.5.4.2 decode()

```

QByteArray QAESEncryption::decode (
    const QByteArray & rawText,
    const QByteArray & key,
    const QByteArray & iv = NULL )
  
```

decode Decodes data with AES

Note

Basically the non-static method of [QAESEncryption::Decrypt](#)

Parameters

<i>rawText</i>	Input data
<i>key</i>	Key
<i>iv</i>	IV vector

Returns

Returns decoded data

See also

[QAESEncryption::Decrypt](#), [QAESEncryption::encode](#)

Definition at line 441 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.5.4.3 Decrypt()**

```

QByteArray QAESEncryption::Decrypt (
    QAESEncryption::Aes level,
    QAESEncryption::Mode mode,
    const QByteArray & rawText,
    const QByteArray & key,
    const QByteArray & iv = NULL,
    QAESEncryption::Padding padding = QAESEncryption::ISO ) [static]
  
```

Decrypt Static decode function.

Parameters

<i>level</i>	AES level of encryption
<i>mode</i>	AES mode
<i>rawText</i>	Encrypted data
<i>key</i>	Key for encrytion
<i>iv</i>	IV vector
<i>padding</i>	Padding

Returns

Returns Decrypted data

See also

[QAESEncryption::decode](#), [QAESEncryption::Crypt](#)

Definition at line 12 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

**9.5.4.4 encode()**

```
QByteArray QAESEncryption::encode (
    const QByteArray & rawText,
    const QByteArray & key,
    const QByteArray & iv = NULL )
```

encode Encodes data with AES

Note

Basically the non-static method of [QAESEncryption::Crypt](#)

Parameters

<i>rawText</i>	Input data
<i>key</i>	Key
<i>iv</i>	IV vector

Returns

Returns encoded data

See also

[QAESEncryption::Crypt](#), [QAESEncryption::decode](#)

Definition at line 391 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

9.5.4.5 ExpandKey()

```

QByteArray QAESEncryption::ExpandKey (
    QAESEncryption::Aes level,
    QAESEncryption::Mode mode,
    const QByteArray & key ) [static]
  
```

ExpandKey Expands the key.

Parameters

<i>level</i>	AES level
<i>mode</i>	AES Mode
<i>key</i>	key

Returns

Returns expanded key (I guess)

See also

[QAESEncryption::expandKey](#)

Definition at line 18 of file [qaesencryption.cpp](#).

Here is the call graph for this function:

9.5.4.6 expandKey()

```
QByteArray QAESEncryption::expandKey (
    const QByteArray & key )
```

ExpandKey Expands the key.

Note

Basically the non-static method of [QAESEncryption::ExpandKey](#)

Parameters

<i>key</i>	key
------------	-----

Returns

Returns expanded key (I guess)

See also

[QAESEncryption::ExpandKey](#)

Definition at line 132 of file [qaesencryption.cpp](#).

Here is the caller graph for this function:

9.5.4.7 RemovePadding()

```
QByteArray QAESEncryption::RemovePadding (
    const QByteArray & rawText,
    QAESEncryption::Padding padding ) [static]
```

RemovePadding Removes padding.

Parameters

<i>rawText</i>	Input data
<i>padding</i>	Padding

Returns

Returns data with removed padding (I guess)

See also

[QAESEncryption::removePadding](#)

Definition at line 23 of file [qaesencryption.cpp](#).

9.5.4.8 removePadding()

```
QByteArray QAESEncryption::removePadding (
    const QByteArray & rawText )
```

RemovePadding Removes padding.

Note

Basically the non-static method of [QAESEncryption::RemovePadding](#)

Parameters

<i>rawText</i>	Input data
----------------	------------

Returns

Returns data with removed padding (I guess)

See also

[QAESEncryption::RemovePadding](#)

Definition at line 490 of file [qaesencryption.cpp](#).

The documentation for this class was generated from the following files:

- C:/Users/salex/Documents/GitHub/PictureCrypt/aes/[qaesencryption.h](#)

9.6 TestPC Class Reference

The [TestPC](#) class AutoTest for [ModelPC](#) Currently used in [main.cpp](#).

```
#include <testpc.h>
```

Inheritance diagram for TestPC:

Collaboration diagram for TestPC:

Public Slots

- int [startTest](#) ()
TestPC::startTest Starts the tests running.

Public Member Functions

- [TestPC](#) ()
TestPC::TestPC Constructor.

Protected Slots

- bool [test](#) (QByteArray data, QImage rImage, QString expectedOutput="ok", int mode=0, QString key="", int bitsUsed=8)
TestPC::test Function calling *TestPC::model* for tests.

9.6.1 Detailed Description

The [TestPC](#) class AutoTest for [ModelPC](#) Currently used in [main.cpp](#).

Definition at line [23](#) of file [testpc.h](#).

9.6.2 Constructor & Destructor Documentation

9.6.2.1 TestPC()

```
TestPC::TestPC ( )
```

[TestPC::TestPC](#) Constructor.

Definition at line [5](#) of file [testpc.cpp](#).

9.6.3 Member Function Documentation

9.6.3.1 startTest

```
int TestPC::startTest ( ) [slot]
```

[TestPC::startTest](#) Starts the tests running.

Note

Tests are configured in [tests.json](#)

Returns

Returns success of all tests

See also

[TestPC::autoTests](#)

Definition at line [42](#) of file [testpc.cpp](#).

Here is the caller graph for this function:

9.6.3.2 test

```
bool TestPC::test (
    QByteArray data,
    QImage rImage,
    QString expectedOutput = "ok",
    int mode = 0,
    QString key = "",
    int bitsUsed = 8 ) [protected], [slot]
```

[TestPC::test](#) Function calling TestPC::model for tests.

Parameters

<i>data</i>	Data for test
<i>rImage</i>	Image for test
<i>expectedOutput</i>	Expected output for test ("ok" if everything is well... ok, else errorcode from ErrorsDict.json)
<i>mode</i>	Mode for embedding
<i>key</i>	Key for for test
<i>bitsUsed</i>	Bits Used

Returns

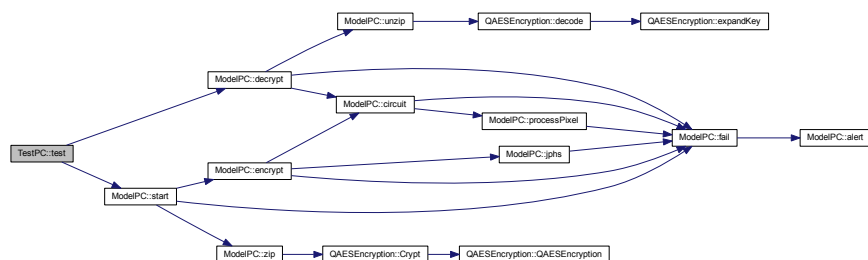

Returns if test is successful

See also

[TestPC::autoTest](#), [ModelPC::start](#), [ModelPC::decrypt](#)

Definition at line 18 of file [testpc.cpp](#).

Here is the call graph for this function:

The documentation for this class was generated from the following files:

9.7 ViewPC Class Reference

The [ViewPC](#) class View layer of the app. Controls [EncryptDialog](#) and [ProgressDialog](#).

```
#include <viewpc.h>
```

Inheritance diagram for ViewPC:

Collaboration diagram for ViewPC:

Public Slots

- void [alert](#) (QString message, bool isWarning=false)
[ViewPC::alert](#) Slot to create `QMessageBox` with message.
- void [saveData](#) (QByteArray Edata)
[ViewPC::saveData](#) Slot to be called to save data using `QFileDialog`.
- void [saveImage](#) (QImage *image)
[ViewPC::saveImage](#) Slot to be called to save image using `QFileDialog`.
- void [setProgress](#) (int val)
[ViewPC::setProgress](#) Slot to set the value of the `ProgressDialog` ([ViewPC::dialog](#)).
- void [abortCircuit](#) ()
[ViewPC::abortCircuit](#) Slot to close `ProgressDialog` ([ViewPC::dialog](#))
- void [setEncryptMode](#) (bool encr)
[ViewPC::setEncryptMode](#) Set the encrypt mode ([ViewPC::isEncrypt](#))
- void [setVersion](#) (QString version)
[ViewPC::setVersion](#) Set the version of the app from [ControllerPC](#).

Signals

- [encrypt](#) (QByteArray data, QImage *image, int mode)
encrypt Signal calling [ModelPC::encrypt](#)
- [decrypt](#) (QImage *_image)
decrypt Signal calling [ModelPC::decrypt](#)
- [abortModel](#) ()
abortModel Signal calling to stop [ModelPC::circuit](#)
- [setBitsUsed](#) (int bitsUsed)
setBitsUsed Sets bits used in [ModelPC](#)
- [setJPHSDir](#) (QString dir)
setJPHSPath Sets the default JPHS directory

Public Member Functions

- [ViewPC](#) (QWidget *parent=nullptr)
- [~ViewPC](#) ()

Public Attributes

- QProgressDialog * [dialog](#)
dialog ProgressDialog used.
- bool [progressDialogClosed](#)
progressDialogClosed Flag, if dialog is closed.
- QJsonObject [errorsDict](#)

Protected Slots

- void [on_fileButton_clicked](#) ()
[ViewPC::on_fileButton_clicked](#) Slot to be called, when according button is pressed.
- void [on_startButton_clicked](#) ()
[ViewPC::on_startButton_clicked](#) Slot to be called, when Start Button is pressed.
- void [on_actionAbout_triggered](#) ()
[ViewPC::on_actionAbout_triggered](#) Opens about page.
- void [on_actionHelp_triggered](#) ()
[ViewPC::on_actionHelp_triggered](#) Opens online documentation.

9.7.1 Detailed Description

The [ViewPC](#) class View layer of the app. Controls [EncryptDialog](#) and ProgressDialog.

See also

[ControllerPC](#), [ModelPC](#), [EncryptDialog](#)

Definition at line 33 of file [viewpc.h](#).

9.7.2 Constructor & Destructor Documentation

9.7.2.1 ViewPC()

```
ViewPC::ViewPC (
    QWidget * parent = nullptr ) [explicit]
```

Definition at line 4 of file [viewpc.cpp](#).

Here is the call graph for this function:

9.7.2.2 ~ViewPC()

```
ViewPC::~~ViewPC ( )
```

Definition at line 27 of file [viewpc.cpp](#).

9.7.3 Member Function Documentation

9.7.3.1 abortCircuit

```
void ViewPC::abortCircuit ( ) [slot]
```

[ViewPC::abortCircuit](#) Slot to close ProgressDialog ([ViewPC::dialog](#))

Definition at line 220 of file [viewpc.cpp](#).

Here is the caller graph for this function:

9.7.3.2 abortModel

```
ViewPC::abortModel ( ) [signal]
```

abortModel Signal calling to stop [ModelPC::circuit](#)

Here is the caller graph for this function:

9.7.3.3 alert

```
void ViewPC::alert (
    QString message,
    bool isWarning = false ) [slot]
```

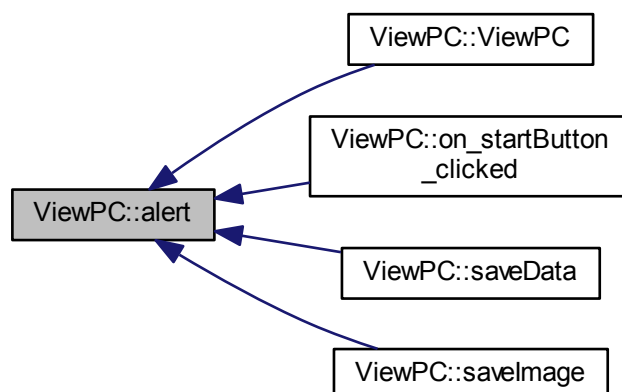

[ViewPC::alert](#) Slot to create QMessageBox with message.

Parameters

<i>message</i>	Message to be shown
<i>isWarning</i>	Flag, if message is critical.

Definition at line 134 of file [viewpc.cpp](#).

Here is the caller graph for this function:

9.7.3.4 decrypt

```
ViewPC::decrypt (
    QImage * _image ) [signal]
```

decrypt Signal calling [ModelPC::decrypt](#)

Parameters

<code>_image</code>	Image for decryption
---------------------	----------------------

Here is the caller graph for this function:

9.7.3.5 encrypt

```
ViewPC::encrypt (
    QByteArray data,
    QImage * image,
    int mode ) [signal]
```

encrypt Signal calling [ModelPC::encrypt](#)

Parameters

<i>data</i>	Data to write
<i>image</i>	Image to be encrypted into.
<i>mode</i>	Mode of encryption

Here is the caller graph for this function:

9.7.3.6 on_actionAbout_triggered

```
void ViewPC::on_actionAbout_triggered ( ) [protected], [slot]
```

[ViewPC::on_actionAbout_triggered](#) Opens about page.

Definition at line 255 of file [viewpc.cpp](#).

Here is the call graph for this function:

9.7.3.7 on_actionHelp_triggered

```
void ViewPC::on_actionHelp_triggered ( ) [protected], [slot]
```

[ViewPC::on_actionHelp_triggered](#) Opens online documentation.

Definition at line 265 of file [viewpc.cpp](#).

9.7.3.8 on_fileButton_clicked

```
void ViewPC::on_fileButton_clicked ( ) [protected], [slot]
```

[ViewPC::on_fileButton_clicked](#) Slot to be called, when according button is pressed.

Definition at line 46 of file [viewpc.cpp](#).

9.7.3.9 on_startButton_clicked

```
void ViewPC::on_startButton_clicked ( ) [protected], [slot]
```

[ViewPC::on_startButton_clicked](#) Slot to be called, when Start Button is pressed.

9.7.4 Encrypting

If Encrypting mode is active the data from text browser or from file from file selector will be opened and checked in size.

Note

File size limit is 16MB

Then the [EncryptDialog](#) opens and image and key is selected. Then the [ViewPC::encrypt](#) signal is called to start [ModelPC::encrypt](#)

9.7.5 Decrypting

Else, the image from file selector is transmitted to [ModelPC::decrypt](#)

Definition at line 68 of file [viewpc.cpp](#).

Here is the call graph for this function:

9.7.5.1 saveData

```
void ViewPC::saveData (
    QByteArray Edata ) [slot]
```

[ViewPC::saveData](#) Slot to be called to save data using QFileDialog.

Parameters

<i>Edata</i>	Encrypted data to be saved.
--------------	-----------------------------

See also

[ModelPC::encrypt](#)

Definition at line 155 of file [viewpc.cpp](#).

Here is the call graph for this function:

9.7.5.2 saveImage

```
void ViewPC::saveImage (
    QImage * image ) [slot]
```

[ViewPC::saveImage](#) Slot to be called to save image using QFileDialog.

Parameters

<i>image</i>	Image to be saved.
--------------	--------------------

See also

[ModelPC::decrypt](#)

Definition at line 176 of file [viewpc.cpp](#).

Here is the call graph for this function:

9.7.5.3 setBitsUsed

```
ViewPC::setBitsUsed (
    int bitsUsed ) [signal]
```

`setBitsUsed` Sets bits used in [ModelPC](#)

Parameters

<i>bitsUsed</i>	The new value
-----------------	---------------

See also

[ModelPC::bitsUsed](#)

Here is the caller graph for this function:

9.7.5.4 setEncryptMode

```
void ViewPC::setEncryptMode (
    bool encl ) [slot]
```

[ViewPC::setEncryptMode](#) Set the enclpt mode (`ViewPC::isEncrypt`)

Parameters

<i>encr</i>	
-------------	--

Definition at line 233 of file [viewpc.cpp](#).

9.7.5.5 setJPHSDir

```
ViewPC::setJPHSDir (  
    QString dir ) [signal]
```

setJPHSPath Sets the default JPHS directory

Parameters

<i>dir</i>	Directory
------------	-----------

9.7.5.6 setProgress

```
void ViewPC::setProgress (  
    int val ) [slot]
```

[ViewPC::setProgress](#) Slot to set the value of the ProgressDialog ([ViewPC::dialog](#)).

Parameters

<i>val</i>	New value of the dialog. If -1, creates ProgressDialog, if 101 closes the dialog.
------------	---

See also

[ViewPC::abortCircuit\(\)](#), [ModelPC::setProgress\(\)](#)

Definition at line 194 of file [viewpc.cpp](#).

Here is the call graph for this function:

9.7.5.7 `setVersion`

```
void ViewPC::setVersion (
    QString version ) [slot]
```

[ViewPC::setVersion](#) Set the version of the app from [ControllerPC](#).

Parameters

<i>version</i>	Version as QString
----------------	--------------------

Definition at line 242 of file [viewpc.cpp](#).

Here is the caller graph for this function:

9.7.6 Member Data Documentation

9.7.6.1 `dialog`

```
QProgressDialog* ViewPC::dialog
```

`dialog` ProgressDialog used.

See also

[ViewPC::setProgress](#), [ViewPC::cancel](#), [ModelPC::setProgress](#)

Definition at line 96 of file [viewpc.h](#).

9.7.6.2 `errorsDict`

```
QJsonObject ViewPC::errorsDict
```

Definition at line 102 of file [viewpc.h](#).

9.7.6.3 progressDialogClosed

```
bool ViewPC::progressDialogClosed
```

progressDialogClosed Flag, if dialog is closed.

See also

[ViewPC::abortCircuit](#), [ViewPC::setProgress](#)

Definition at line 101 of file [viewpc.h](#).

Classes

- class [QAESEncryption](#)

The [QAESEncryption](#) class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: <https://github.com/bricke/Qt-AES>.

00001 # Contributor Covenant Code of Conduct
00002
00003 ## Our Pledge
00004
00005 In the interest of fostering an open and welcoming environment, we as contributors and maintainers
    pledge to making participation in our project and our community a harassment-free experience for everyone,
    regardless of age, body size, disability, ethnicity, gender identity and expression, level of experience,
    nationality, personal appearance, race, religion, or sexual identity and orientation.
00006
00007 ## Our Standards
00008
00009 Examples of behavior that contributes to creating a positive environment include:
00010
00011 * Using welcoming and inclusive language
00012 * Being respectful of differing viewpoints and experiences
00013 * Gracefully accepting constructive criticism
00014 * Focusing on what is best for the community
00015 * Showing empathy towards other community members
00016
00017 Examples of unacceptable behavior by participants include:
00018
00019 * The use of sexualized language or imagery and unwelcome sexual attention or advances
00020 * Trolling, insulting/derogatory comments, and personal or political attacks
00021 * Public or private harassment
00022 * Publishing others' private information, such as a physical or electronic address, without explicit
    permission
00023 * Other conduct which could reasonably be considered inappropriate in a professional setting
00024
00025 ## Our Responsibilities
00026
00027 Project maintainers are responsible for clarifying the standards of acceptable behavior and are
    expected to take appropriate and fair corrective action in response to any instances of unacceptable behavior.
00028
00029 Project maintainers have the right and responsibility to remove, edit, or reject comments, commits,
    code, wiki edits, issues, and other contributions that are not aligned to this Code of Conduct, or to ban
    temporarily or permanently any contributor for other behaviors that they deem inappropriate, threatening,
    offensive, or harmful.
00030
00031 ## Scope
00032
00033 This Code of Conduct applies both within project spaces and in public spaces when an individual is
    representing the project or its community. Examples of representing a project or community include using an
    official project e-mail address, posting via an official social media account, or acting as an appointed
    representative at an online or offline event. Representation of a project may be further defined and clarified by
    project maintainers.
00034
00035 ## Enforcement
00036
00037 Instances of abusive, harassing, or otherwise unacceptable behavior may be reported by contacting the
    project team at a.kovrigin0@gmail.com. The project team will review and investigate all complaints, and will
    respond in a way that it deems appropriate to the circumstances. The project team is obligated to maintain
    confidentiality with regard to the reporter of an incident. Further details of specific enforcement policies
    may be posted separately.
00038
00039 Project maintainers who do not follow or enforce the Code of Conduct in good faith may face temporary
    or permanent repercussions as determined by other members of the project's leadership.
00040
00041 ## Attribution
00042
00043 This Code of Conduct is adapted from the [Contributor Covenant][homepage], version 1.4, available at
    [http://contributor-covenant.org/version/1/4][version]

00001 # PictureCrypt
00002 Make your pictures crypted.
00003
00004
00005 ## About
00006 Project is made only using QT.
00007 [QAESEncryption](http://github.com/bricke/Qt-AES) by bricke was also used.
00008 MVC pattern used.
00009 PictureCrypt project is UI based, the model contains all buisness logic and can work as standalone
      class.
00010
00011 ## External use
00012 ModelPC class can be used externally (without UI)
00013 ```
00014 #include <modelpc.h>
00015 #include <QByteArray>
00016 #include <QImage>
00017
00018 ...
00019
00020 ModelPC * model = new ModelPC(ver);
00021 // ver is version of the app, used to check the data structure version
00022 // ver is type long and is calculated as if version is "x.y.z" => ver = x * 65536 + y * 256 + z
00023 // Default parameter is 2^17 (2.0.0)
00024
00025 // Connecting signals
00026
00027 // Essential ones
00028
00029 model->saveData(QByteArray data)
00030 // Used to return the retrieved data
00031
00032 model->saveImage(QImage * image)
00033 // Used to return the modified image
00034
00035 // Extra ones
00036
00037 model->alertView(QString message, bool isWarning)
00038 // Used for messages to be shown to users
00039
00040 model->setProgress(int val)
00041 // Used to show user the progress of embedding
00042 // -1 indicates the creation of some kind of progress dialog
00043 // from 0 to 100 shows the progress
00044 // 101 indicates that progress dialog should be closed
00045
00046 ```
00047
00048 ## Avaible methods
00049 ### Essential ones
00050 ##### start
00051 Used for embedding
00052
00053 Parameters:
00054 data    Data to be encrypted
00055 _image  Image to be encrypted into.
00056 _bitsUsed Bits per byte, see also ModelPC::bitsUsed
00057 key     Key, if default (empty), random key of 64 charachters will be generated.
00058 mode    Mode of encryption
00059 ```
00060 model->start(QByteArray data, QImage image, int mode = 0, QString key = "", int _bitsUsed = 8);
00061 ```
00062
00063 ##### decrypt

```

```
