PictureCrypt

1.4.0

Generated by Doxygen 1.8.11

Contents

Chapter 1

PictureCrypt

Project made using QT Creator in C++

1.1   About

A simple steganography project which hides data in images This project is built using MVC pattern and features GUI. `Qt` and `QAESEncryption` by `bricke` were used.

1.2   Download

Get the binary files at `latest release page` Or download latest **UNSTABLE** binary file for linux `here`

1.3   Realisation

To create the encrypted image, you need to select any file for encryption, then using EncryptDialog you select the image to store the data. Then output image is generated.

Attention

Output image format available is .PNG, because .jpg isn't lossless, so the pixels containing data would be seriously simplified and the data damaged. .BMP isn't used, because noone really uses it and .PNG is just compressed .BMP (more or less)

Note

JPHS support is under development :D

1.4   How can someone use it?

Well... Anyone who wants to securely commuicate. For example your boss watches your inbox, so you do the work and don't chat with your friends about the bar, they've just visited. Using this app you can send them a photo of your desk, saying it's my new working space, but inside the image there is secret message saying "Wanna get another beer tonight? xD". Boss sees this image, but doesn't spot anyhing. Great example...

1.5 Structure of the project.

Project is done via MVC Pattern. View and Model layers are totally isolated and run on different threads.

Code from controller.cpp

```
view = new ViewPC();
model = new ModelPC(version);
QThread * modelThread = new QThread();
model->moveToThread(modelThread);
modelThread->start();
```

So when Model is hard-working, View layer is just fine.

Layers also have a ton of functions, so here is a scheme, that I was doing for about 10 hours, which demonstrates the most important functions and classes in the project. And everything is clickable here, so try it out!
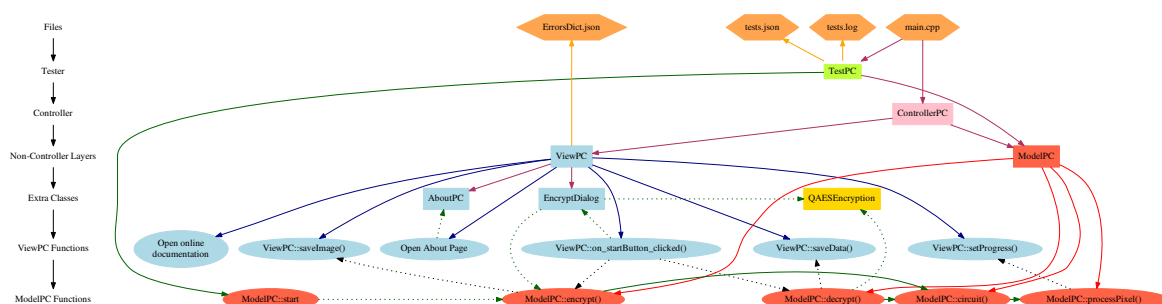

Well... I think you didn't quite understand what is happening here... So hop into my "User-friendly" Documentation!

See source on https://github.com/waleko/PictureCrypt

Note

QAESEncryption class done by Bricke

1.6 External use

ModelPC class can be used externally (without UI)

Note

    TestPC class was introduced recently, its use is adviced.

```
#include <modelpc.h>
#include <testpc.h>
#include <QByteArray>
#include <QImage>

#include <QDebug> // Just for demonstration use

...

if(TestPC::Test())
    return;
ModelPC * model = new ModelPC();

// Embedding
QImage * resultImage = model->start(QByteArray data, // Data to be embedded
                                    QImage *image, // Image for embedding
                                    int mode = 0, // Mode of embedding
                                    QString key = "", // Key for extra-encryption (if empty, key will be
        generated automatically)
                                    int bitsUsed = 8, // Bits per Byte used (better explaination
        ModelPC::bitsUsed)
                                    QString *error = nullptr); // Error output, if everything is ok, error
        will be "ok"
if(*error != "ok")
    return;
// Note *error is just a code of error (like "muchdata", dictionary of error codes is also available on
        github.

// De-embedding
QByteArray output = model->decrypt(QImage * image, // Image with hidden data
                                   QString *_error = nullptr); // Error output
if(data == output)
   qDebug() << "Great success!";
else
   qDebug() << "Fiasco :(";
```

::setProgress

1.7 JPHS use

The newer versions of the app have jphs support, but they don't have jphs built in as it is provided under GNU
General Public License v3.0, is "for test purposes only" and is illegal in some countries, so...

Attention

    We support JPHS, but we don't use any responsibility for it, we never used or downloaded it, we just used
.exe output in the web, and it somehow works by chance. All responsibility for using jphs is on you, that
is why we use made only optionally. That means that to use jphs with our app you will have to download
the jphs yourself and specify the jphs directory. However we provide link to the site where you can down-
load the supported version of the jphs: http://linux01.gwdg.de/∼alatham/stego.html As
it's not our site publishing the dangerous zip file, we just put link to that site (Google does that too, so what?
Sue Google?), This text is subject to United Nations' Universal Declaration of Human Rights, (see Article 19
http://www.un.org/en/universal-declaration-human-rights):

        Everyone has the right to freedom of opinion and expression; this right includes freedom to hold
opinions without interference and to seek, receive and impart information and ideas through any
media and regardless of frontiers.

    And I typed this link randomly, and I'm scared...

AboutPC
```

Public Member Functions

- AboutPC (QWidget ∗parent=0)
- ∼AboutPC ()
- void setVersion (QString version)

    AboutPC::setVersion Function to set the version display.

7.1.1 Detailed Description

The AboutPC class The About Page dialog.

Definition at line 12 of file aboutpc.h.

7.1.2 Constructor & Destructor Documentation

7.1.2.1 AboutPC::AboutPC (QWidget ∗ *parent =* 0) `[explicit]`

Definition at line 4 of file aboutpc.cpp.

7.1.2.2 AboutPC::∼AboutPC ( )

Definition at line 11 of file aboutpc.cpp.

7.1.3 Member Function Documentation

7.1.3.1 void AboutPC::setVersion (QString *version*)

AboutPC::setVersion Function to set the version display.

Parameters

version	Version as QString

Definition at line 19 of file aboutpc.cpp.

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

- aboutpc.h
- aboutpc.cpp

7.2 ControllerPC Class Reference

The ControllerPC class Controller class, which controls View and Model layers.

```
#include <controllerpc.h>
```

Inheritance diagram for ControllerPC:
Collaboration diagram for ControllerPC:
Public Slots

- void abortCircuit ()

    ControllerPC::abortCircuit Slot to be called when ProgressDialog in ViewPC is closed. It flags ModelPC to stop.
- void setJPHSDir (QString dir)

    ControllerPC::setJPHSDir Sets JPHS default dir.

Public Member Functions

- ControllerPC ()

    ControllerPC::ControllerPC Constructor of controller Constructor runs auto-test for ModelPC, creates Model Class (ModelPC) and View Class (ViewPC). All signals and slots are connected here.

Public Attributes

- long int version

    version Version of the app
- QString versionString

    versionString Version of the app as QString.

7.2.1 Detailed Description

The ControllerPC class Controller class, which controls View and Model layers.

See also

> ViewPC, ModelPC

Definition at line 20 of file controllerpc.h.

7.2.2 Constructor & Destructor Documentation

7.2.2.1 ControllerPC::ControllerPC ( )

ControllerPC::ControllerPC Constructor of controller Constructor runs auto-test for ModelPC, creates Model Class (ModelPC) and View Class (ViewPC). All signals and slots are connected here.

Controller class

Note

> Version of the app is specified here.

Definition at line 9 of file controllerpc.cpp.

Here is the call graph for this function:

7.2.3 Member Function Documentation

7.2.3.1 void ControllerPC::abortCircuit ( ) `[slot]`

ControllerPC::abortCircuit Slot to be called when ProgressDialog in ViewPC is closed. It flags ModelPC to stop.

Definition at line 37 of file controllerpc.cpp.

Here is the caller graph for this function:

```
┌─────────────────────────┐      ┌─────────────────────────────┐
│ ControllerPC::abortCircuit │◄────│ ControllerPC::ControllerPC   │
└─────────────────────────┘      └─────────────────────────────┘
```

7.2.3.2 void ControllerPC::setJPHSDir (QString *dir*) `[slot]`

ControllerPC::setJPHSDir Sets JPHS default dir.

Parameters

dir	Directory

Definition at line 45 of file controllerpc.cpp.

Here is the caller graph for this function:

```
┌─────────────────────────┐      ┌─────────────────────────────┐
│ ControllerPC::setJPHSDir  │◄────│ ControllerPC::ControllerPC   │
└─────────────────────────┘      └─────────────────────────────┘
```

7.2.4 Member Data Documentation

7.2.4.1 long int ControllerPC::version

version Version of the app

Definition at line 28 of file controllerpc.h.

7.2.4.2 QString ControllerPC::versionString

versionString Version of the app as QString.

Definition at line 32 of file controllerpc.h.

The documentation for this class was generated from the following files:

- controllerpc.h
- controllerpc.cpp

7.3 EncryptDialog Class Reference

The EncryptDialog class Class to get the image and key to store secret info.

```
#include <encryptdialog.h>
```

Inheritance diagram for EncryptDialog:

Collaboration diagram for EncryptDialog:

Public Slots

- void on_fileButton_clicked ()

  EncryptDialog::on_fileButton_clicked Slot to select the image.
- void on_buttonBox_accepted ()

  EncryptDialog::on_buttonBox_accepted Slot to start the encryption. Successful closing of the app.
- void on_buttonBox_rejected ()

  EncryptDialog::on_buttonBox_rejected Slot to reject the encryption.
- void on_bitsSlider_valueChanged (int value)

  EncryptDialog::on_bitsSlider_valueChanged Slot if value of the bits slider is changed.

Public Member Functions

- EncryptDialog (QByteArray _data, QWidget ∗parent=0)

  EncryptDialog::EncryptDialog Constructor of the class. Input data is saved here and some variables are set here.
- ∼EncryptDialog ()
- QByteArray zip ()

  EncryptDialog::zip Zipping algorithm It copresses the data and then compresses it using qCompress()

Public Attributes

- QByteArray data

  data Input data
- bool success

  success Flag, if image was successfully selected and data was encrypted.
- QByteArray compr_data

  compr_data Compressed data, aka Output data.
- QString inputFileName

  inputFileName Filename of the image.
- long long int size

  size Size of the image in square pixels
- QString key

  key Key to be used for encryption in EncrytDialog::zip
- bool goodPercentage

  goodPercentage Flag if area of the used data via encryption is less than 70% of the area of the image.
- int val

  val Value of the slider
- int bitsUsed

  bitsUsed Bits used per byte of pixel.
- QImage image

  image Inputted image

7.3.1 Detailed Description

The EncryptDialog class Class to get the image and key to store secret info.

Note

Not the most important and well written class.

See also

ViewPC

Definition at line 21 of file encryptdialog.h.

7.3.2   Constructor & Destructor Documentation

7.3.2.1   EncryptDialog::EncryptDialog (QByteArray _data, QWidget ∗ parent = 0) `[explicit]`

EncryptDialog::EncryptDialog Constructor of the class. Input data is saved here and some variables are set here.

Parameters

_data	Input data.
parent	Parent (not in use)

Definition at line 9 of file encryptdialog.cpp.

Here is the call graph for this function:
7.3.2.2   EncryptDialog::∼EncryptDialog (   )

Definition at line 26 of file encryptdialog.cpp.

7.3.3   Member Function Documentation

7.3.3.1   void EncryptDialog::on_bitsSlider_valueChanged (int value) `[slot]`

EncryptDialog::on_bitsSlider_valueChanged Slot if value of the bits slider is changed.

Parameters

value	Well, value

Definition at line 107 of file encryptdialog.cpp.

7.3.3.2   void EncryptDialog::on_buttonBox_accepted (   ) `[slot]`

EncryptDialog::on_buttonBox_accepted Slot to start the encryption. Successful closing of the app.

Definition at line 82 of file encryptdialog.cpp.

Here is the call graph for this function:

7.3.3.3 void EncryptDialog::on_buttonBox_rejected ( ) `[slot]`

EncryptDialog::on_buttonBox_rejected Slot to reject the encryption.

Definition at line 98 of file encryptdialog.cpp.

7.3.3.4 void EncryptDialog::on_fileButton_clicked ( ) `[slot]`

EncryptDialog::on_fileButton_clicked Slot to select the image.

Definition at line 57 of file encryptdialog.cpp.

7.3.3.5 QByteArray EncryptDialog::zip ( )

EncryptDialog::zip Zipping algorithm It copresses the data and then compresses it using qCompress()

Returns

Returns Compressed data.

See also

ModelPC::unzip

Definition at line 46 of file encryptdialog.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:
7.3.4 Member Data Documentation

7.3.4.1 int EncryptDialog::bitsUsed

bitsUsed Bits used per byte of pixel.

See also

> ModelPC::circuit

Definition at line 75 of file encryptdialog.h.

7.3.4.2 QByteArray EncryptDialog::compr_data

compr_data Compressed data, aka Output data.

Definition at line 50 of file encryptdialog.h.

7.3.4.3 QByteArray EncryptDialog::data

data Input data

Definition at line 42 of file encryptdialog.h.

7.3.4.4 bool EncryptDialog::goodPercentage

goodPercentage Flag if area of the used data via encryption is less than 70% of the area of the image.

Definition at line 66 of file encryptdialog.h.

7.3.4.5 QImage EncryptDialog::image

image Inputted image

Definition at line 79 of file encryptdialog.h.

7.3.4.6 QString EncryptDialog::inputFileName

inputFileName Filename of the image.

Definition at line 54 of file encryptdialog.h.

7.3.4.7 QString EncryptDialog::key

key Key to be used for encryption in EncrytDialog::zip

Definition at line 62 of file encryptdialog.h.

7.3.4.8   long long int EncryptDialog::size

size Size of the image in square pixels

Definition at line 58 of file encryptdialog.h.

7.3.4.9   bool EncryptDialog::success

success Flag, if image was successfully selected and data was encrypted.

Definition at line 46 of file encryptdialog.h.

7.3.4.10   int EncryptDialog::val

val Value of the slider

Definition at line 70 of file encryptdialog.h.

The documentation for this class was generated from the following files:

- encryptdialog.h
- encryptdialog.cpp

7.4   ModelPC Class Reference

The ModelPC class Model Layer of the app. Main class that does the work of PictureCrypt logic Controled by ControllerPC.

```
#include <modelpc.h>
```

Inheritance diagram for ModelPC:

Collaboration diagram for ModelPC:

QObject
ModelPC

Public Types

- enum CryptMode { NotDefined, v1_3, v1_4, jphs_mode }

Public Slots

- QImage ∗ encrypt (QByteArray data, QImage ∗image, int _mode, QString key="", int _bitsUsed=8, QString ∗_error=nullptr)

  ModelPC::encrypt Slot to zip and inject data and provide it with some extra stuff After completion start standard ModelPC::inject Isn't used in PictureCrypt, but used can be used in other - custom projects.
- QImage ∗ inject (QByteArray encr_data, QImage ∗image, int _mode, int _bitsUsed=8, QString ∗_↩ error=nullptr)

  ModelPC::inject Slot to be called when encrypt mode in ViewPC is selected and started.
- QByteArray decrypt (QImage ∗image, QString key, int _mode=0, QString ∗_error=nullptr)

  ModelPC::decrypt Slot to be called when decrypt mode in ViewPC is selected and started.
- void fail (QString message)

  ModelPC::fail Slot to stop execution of cryption.
- void alert (QString message, bool isWarning=false)

  ModelPC::alert Function emits signal ModelPC::alertView and calls ViewPC::alert.

Signals

- void alertView (QString messageCode, bool isWarning)

  alertView Signal to be called to create MessageBox.
- void saveData (QByteArray data)

  saveData Signal to be called to save data from ModelPC::decrypt.
- void saveImage (QImage ∗image)

  saveImage Signal to be called to save image from ModelPC::encrypt.
- void setProgress (int val)

  setProgress Signal to be called to set progress of ProgressDialog.

Public Member Functions

- *ModelPC* ()

  ModelPC::ModelPC Constructor Unit tests are run here.
- QByteArray *unzip* (QByteArray data, QByteArray key)

  ModelPC::unzip Unzip data from ModelPC::decrypt. Just mirrored EncryptDialog::zip.

Static Public Member Functions

- static QImage ∗ *Encrypt* (QByteArray data, QImage ∗image, int _mode, QString key="", int _bitsUsed=8, QString ∗_error=nullptr)
- static QImage ∗ *Inject* (QByteArray encr_data, QImage ∗image, int _mode, int _bitsUsed=8, QString ∗_↩ error=nullptr)
- static QByteArray *Decrypt* (QImage ∗image, QString key, int _mode=0, QString ∗_error=nullptr)

Public Attributes

- bool *success*

  success Flag that true by default, but in case of error or cancelling of ProgressDialog it turns to false, which stops execution of ModelPC::circuit
- long *version*

  version Version of the class
- QString *versionString*

  versionString Version as string
- QString *defaultJPHSDir*

  defaultJPHSDir Default JPHS directory

Protected Member Functions

- void *circuit* (QImage ∗image, QByteArray ∗data, long long int countBytes)

  ModelPC::circuit The brain of the app. Via special circuit stores data in image.
- void *jphs* (QImage ∗image, QByteArray ∗data)

  ModelPC::jphs JPHS function to use jphide and jpseek (currently under development)
- void *processPixel* (QPoint pos, QVector< QPoint > ∗were, bool isEncrypt)

  ModelPC::processPixel Processes every pixel. Reads its contains or writes data.
- void *encryptv1_4* (QImage ∗image, QByteArray data, QString key)

  ModelPC::encryptv1_4 Encrypts and injects data to image used in v1.4+.
- QByteArray *decryptv1_3* (QImage ∗image, QString key)

  ModelPC::decryptv1_3 Decrytps data from image in v1.3.
- QByteArray *decryptv1_4* (QImage ∗image, QString key)

  ModelPC::decryptv1_4 Decrypts data from image in v1.4+.
- void *proccessPixelsv1_4* (QImage ∗image, QByteArray ∗data, QByteArray key, bool isEncrypt, QVector< QPair< QPoint, QPair< int, int > > > ∗were, long long size=-1)

  ModelPC::proccessPixelsv1_4 Hides (or retrieves) data to/from pixels.
- QByteArray *zip* (QByteArray data, QByteArray key)

  ModelPC::zip Zip function, copy of EncryptDialog::zip Used for ModelPC in custom projects, other than PictureCrypt.

Protected Attributes

- QString ∗ error

    error Current error

7.4.1 Detailed Description

The ModelPC class Model Layer of the app. Main class that does the work of PictureCrypt logic Controled by ControllerPC.

7.4.4 Member Function Documentation

7.4.4.1 void ModelPC::alert (QString *message,* bool *isWarning =* false) [slot]

ModelPC::alert Function emits signal ModelPC::alertView and calls ViewPC::alert.

Parameters

message	Message to be transmitted.
isWarning	Flag if message is critical.

See also

ViewPC::alert

Definition at line 940 of file modelpc.cpp.

Here is the caller graph for this function:

7.4.4.2   void ModelPC::alertView (QString *messageCode,* bool *isWarning*)   `[signal]`

alertView Signal to be called to create MessageBox.

Parameters

messageCode	Message Code to be shown.
isWarning	Flag if message is critical.

See also

> ModelPC::alert, ViewPC::alert

Here is the caller graph for this function:

7.4.4.3   void ModelPC::circuit (QImage ∗ *image,* QByteArray ∗ *data,* long long int *countBytes*)   `[protected]`

ModelPC::circuit The brain of the app. Via special circuit stores data in image.

The circuit itself can be found in documentation or in commentaries in source.

Parameters

image	Image to be processed.
data	Data to be processed.
countBytes	Number of bytes to be read or written.

See also

> ModelPC::processPixel

Definition at line 359 of file modelpc.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

**7.4.4.4 QByteArray ModelPC::Decrypt (QImage ∗ *image,* QString *key,* int *_mode =* 0*,* QString ∗ *_error =* nullptr *)*
`[static]`

Definition at line 34 of file modelpc.cpp.

Here is the call graph for this function:

7.4.4.5 QByteArray ModelPC::decrypt (QImage ∗ *image,* QString *key,* int *_mode =* 0*,* QString ∗ *_error =* nullptr **)
[slot]

ModelPC::decrypt Slot to be called when decrypt mode in ViewPC is selected and started.

7.4.4.5 QByteArray ModelPC::decrypt (QImage ∗ *image,* QString *key,* int *_mode =* 0*,* QString ∗ *_error =* nullptr **)
[slot]

Parameters

image	Image to be decrypted.
key	Keyphrase with which the data is injected
_mode	Mode for decryption
_error	Error output

Returns

Returns decrypted data

See also

ViewPC::on_startButton_clicked, ModelPC::inject, ModelPC::circuit

Definition at line 212 of file modelpc.cpp.

Here is the call graph for this function:

7.4.4.6 QByteArray ModelPC::decryptv1_3 (QImage ∗ *image,* QString *key*) `[protected]`

ModelPC::decryptv1_3 Decrytps data from image in v1.3.

Parameters

image	Image with data
key	Key

Returns

Returns obtained data

Definition at line 777 of file modelpc.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.4.7 QByteArray ModelPC::decryptv1_4 (QImage ∗ *image,* QString *key*) `[protected]`

ModelPC::decryptv1_4 Decrypts data from image in v1.4+.

Parameters

image	Image with data
key	Key

Returns

Returns obtained data

Definition at line 602 of file modelpc.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.4.8 QImage ∗ ModelPC::Encrypt (QByteArray *data,* QImage ∗ *image,* int *_mode,* QString *key =* " ", int *_bitsUsed =* 8, QString ∗ *_error =* nullptr) [static]

Definition at line 24 of file modelpc.cpp.

7.4.4.9 QImage ∗ ModelPC::encrypt (QByteArray *data,* QImage ∗ *image,* int *_mode,* QString *key =* " ", int *_bitsUsed =* 8, QString ∗ *_error =* nullptr) [slot]

ModelPC::encrypt Slot to zip and inject data and provide it with some extra stuff After completion start standard ModelPC::inject Isn't used in PictureCrypt, but used can be used in other - custom projects.

Parameters

data	Data for embedding
image	Image for embedding
mode	Mode for embedding
key	Key for extra encryption
_bitsUsed	Bits per byte (see ModelPC::bitsUsed)
_error	Error output

Returns

Returns image with embedded data

See also

   ModelPC::inject

Definition at line 51 of file modelpc.cpp.

Here is the call graph for this function:

7.4.4.10 void ModelPC::encryptv1_4 (QImage ∗ *image,* QByteArray *data,* QString *key*) `[protected]`

ModelPC::encryptv1_4 Encrypts and injects data to image used in v1.4+.

Parameters

image	Image for injecting
data	Data for embedding

Definition at line 560 of file modelpc.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.4.11   void ModelPC::fail (QString *message*) `[slot]`

ModelPC::fail Slot to stop execution of cryption.

Parameters

message	Message for user

Definition at line 283 of file modelpc.cpp.

Here is the call graph for this function:

ModelPC::fail	→	ModelPC::alert

Here is the caller graph for this function:

7.4.4.12   QImage ∗ ModelPC::Inject (QByteArray *encr_data,* QImage ∗ *image,* int *_mode,* int *_bitsUsed =* 8, QString ∗ *_error =* nullptr) `[static]`

Definition at line 29 of file modelpc.cpp.

Here is the call graph for this function:

**7.4.4.13   QImage ∗ ModelPC::inject (QByteArray *encr_data,* QImage ∗ *image,* int *_mode,* int *_bitsUsed =* 8*,* QString ∗ *_error =*
`nullptr` **)** `[slot]`

ModelPC::inject Slot to be called when encrypt mode in ViewPC is selected and started.

Parameters

encr_data	Data to be inserted to an image.
image	Image to be inserted in.
mode	Mode of encryption
_bitsUsed	Bits per byte used
_error	Error output

Returns

Returns image with embedded data.

See also

```

7.4.4.15 void ModelPC::proccessPixelsv1_4 (QImage ∗ *image,* QByteArray ∗ *data,* QByteArray *key,* bool *isEncrypt,* QVector<
QPair< QPoint, QPair< int, int > > > ∗ *were,* long long *size =* −1) `[protected]`

ModelPC::proccessPixelsv1_4 Hides (or retrieves) data to/from pixels.

Parameters

image	Original image
data	Data to write (Pointer to empty QByteArray if decrypting)
key	Key
isEncrypt	Mode of Cryption (true -> encryption, false -> decryption)
were	Were vector for visited pixels
size	Size of reading data, unneeded if writing

Definition at line 663 of file modelpc.cpp.

Here is the caller graph for this function:

7.4.4.16 void ModelPC::processPixel (QPoint *pos,* QVector< QPoint > ∗ *were,* bool *isEncrypt*) `[protected]`

ModelPC::processPixel Processes every pixel. Reads its contains or writes data.

Parameters

pos	Position of pixel
were	Vector array containing pixels, that were already processed.
isEncrypt	Mode of operation. If true encryption operations will continue, else the decryption ones.

Definition at line 500 of file modelpc.cpp.

Here is the call graph for this function:
Here is the caller graph for this function:

**7.4.4.17 void ModelPC::saveData (QByteArray *data*) ** `[signal]`

saveData Signal to be called to save data from ModelPC::decrypt.

Parameters

data	Data to be saved.

Here is the caller graph for this function:

**7.4.4.18 void ModelPC::saveImage (QImage ∗ *image*) ** `[signal]`

saveImage Signal to be called to save image from ModelPC::encrypt.

Parameters

image	Image to be saved.

Here is the caller graph for this function:

7.4.4.19 void ModelPC::setProgress (int *val*) `[signal]`

setProgress Signal to be called to set progress of ProgressDialog.

Parameters

val	Value to be set.

See also

> ViewPC::setProgress

Here is the caller graph for this function:
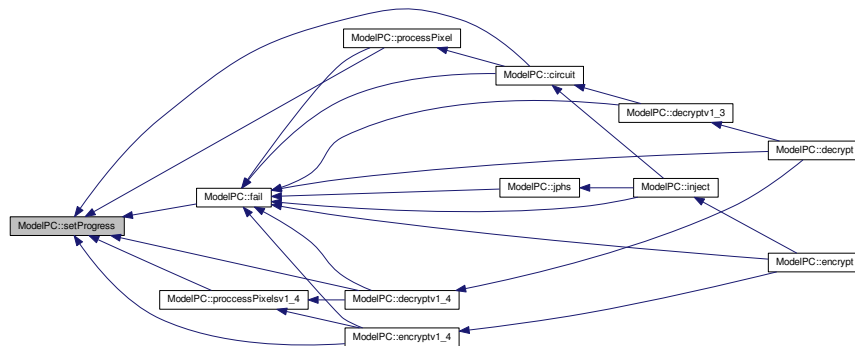

7.4.4.20 QByteArray ModelPC::unzip (QByteArray *data,* QByteArray *key*)

ModelPC::unzip Unzip data from ModelPC::decrypt. Just mirrored EncryptDialog::zip.

Parameters

data	Data to be decrypted.
key	Key to decrypt the data.

Returns

> Returns data

See also

> EncryptDialog::zip, ModelPC::decrypt, ModelPC::zip

Definition at line 879 of file modelpc.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.4.4.21 QByteArray ModelPC::zip (QByteArray *data,* QByteArray *key*) `[protected]`

ModelPC::zip Zip function, copy of EncryptDialog::zip Used for ModelPC in custom projects, other than PictureCrypt.

Parameters

data	Data to be encrypted
key	Key for encryption

Returns

Returns decrypted data

See also

ModelPC::start, ModelPC::inject, ModelPC::unzip

Definition at line 896 of file modelpc.cpp.

Here is the call graph for this function:

- modelpc.cpp

7.5 QAESEncryption Class Reference

The QAESEncryption class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: https://github.↩com/bricke/Qt-AES.

`#include <qaesencryption.h>`

Inheritance diagram for QAESEncryption:
Collaboration diagram for QAESEncryption:

Public Types

- enum Aes { AES_128, AES_192, AES_256 }

  The Aes enum AES Level AES Levels The class supports all AES key lenghts.

- enum Mode { ECB, CBC, CFB, OFB }

  The Mode enum AES Mode The class supports the following operating modes ECB CBC CFB OFB.

- enum Padding { ZERO, PKCS7, ISO }

  The Padding enum Padding By default the padding method is ISO, however, the class supports:

Public Member Functions

- QAESEncryption (QAESEncryption::Aes level, QAESEncryption::Mode mode, QAESEncryption::Padding padding=QAESEncryption::ISO)
- QByteArray encode (const QByteArray &rawText, const QByteArray &key, const QByteArray &iv=NULL)
    encode Encodes data with AES
- QByteArray decode (const QByteArray &rawText, const QByteArray &key, const QByteArray &iv=NULL)
    decode Decodes data with AES
- QByteArray removePadding (const QByteArray &rawText)
    RemovePadding Removes padding.
- QByteArray expandKey (const QByteArray &key)
    ExpandKey Expands the key.

Static Public Member Functions

- static QByteArray Crypt (QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray &rawText, const QByteArray &key, const QByteArray &iv=NULL, QAESEncryption::Padding padding=QA↩ ESEncryption::ISO)
    Crypt Static encode function.
- static QByteArray Decrypt (QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray &rawText, const QByteArray &key, const QByteArray &iv=NULL, QAESEncryption::Padding padding=QAE↩ SEncryption::ISO)
    Decrypt Static decode function.
- static QByteArray ExpandKey (QAESEncryption::Aes level, QAESEncryption::Mode mode, const QByteArray &key)
    ExpandKey Expands the key.
- static QByteArray RemovePadding (const QByteArray &rawText, QAESEncryption::Padding padding)
    RemovePadding Removes padding.

7.5.1 Detailed Description

The QAESEncryption class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: `https://github.↩ com/bricke/Qt-AES`.

Author

Bricke (Matteo B)

Definition at line 14 of file qaesencryption.h.

7.5.2 Member Enumeration Documentation

7.5.2.1 enum QAESEncryption::Aes

The Aes enum AES Level AES Levels The class supports all AES key lenghts.

AES_128 AES_192 AES_256

Enumerator

> **AES_128**
> **AES_192**
> **AES_256**

Definition at line 27 of file qaesencryption.h.

7.5.2.2 enum QAESEncryption::Mode

The Mode enum AES Mode The class supports the following operating modes ECB CBC CFB OFB.

Enumerator

> **ECB**
>
> **CBC**
>
> **CFB**
>
> **OFB**

Definition at line 40 of file qaesencryption.h.

7.5.2.3 enum QAESEncryption::Padding

The Padding enum Padding By default the padding method is ISO, however, the class supports:

ZERO PKCS7 ISO

Enumerator

> **ZERO**
>
> **PKCS7**
>
> **ISO**

Definition at line 55 of file qaesencryption.h.

7.5.3 Constructor & Destructor Documentation

7.5.3.1 QAESEncryption::QAESEncryption (QAESEncryption::Aes *level,* QAESEncryption::Mode *mode,* QAESEncryption::Padding *padding =* QAESEncryption::ISO)

Definition at line 67 of file qaesencryption.cpp.

Here is the caller graph for this function:

7.5.4 Member Function Documentation

7.5.4.1 QByteArray QAESEncryption::Crypt (QAESEncryption::Aes *level,* QAESEncryption::Mode *mode,* const QByteArray & *rawText,* const QByteArray & *key,* const QByteArray & *iv =* `NULL`, QAESEncryption::Padding *padding =* QAESEncryption::ISO) `[static]`

Crypt Static encode function.

Parameters

level	AES level of encryption
mode	AES mode
rawText	Input data
key	Key for encrytion
iv	IV vector
padding	Padding

Returns

Returns encrypted data

See also

QAESEncryption::encode, QAESEncryption::Decrypt

Definition at line 6 of file qaesencryption.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:
7.5.4.2 QByteArray QAESEncryption::decode (const QByteArray & *rawText,* const QByteArray & *key,* const QByteArray & *iv =* `NULL`)

decode Decodes data with AES

Note

Basically the non-static method of QAESEncryption::Decrypt

Parameters

rawText	Input data
key	Key
iv	IV vector

Returns

Returns decoded data

See also

QAESEncryption::Decrypt, QAESEncryption::encode

Definition at line 441 of file qaesencryption.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.5.4.3 QByteArray QAESEncryption::Decrypt (QAESEncryption::Aes *level,* QAESEncryption::Mode *mode,* const QByteArray & *rawText,* const QByteArray & *key,* const QByteArray & *iv =* NULL, QAESEncryption::Padding *padding =* QAESEncryption::ISO) `[static]`

Decrypt Static decode function.

Parameters

level	AES level of encryption
mode	AES mode
rawText	Encrypted data
key	Key for encrytion
iv	IV vector
padding	Padding

Generated by Doxygen

Returns

Returns Decrypted data

See also

QAESEncryption::decode, QAESEncryption::Crypt

Definition at line 12 of file qaesencryption.cpp.

Here is the call graph for this function:

7.5.4.4 QByteArray QAESEncryption::encode (const QByteArray & *rawText,* const QByteArray & *key,* const QByteArray & *iv =* `NULL`)

encode Encodes data with AES

Note

Basically the non-static method of QAESEncryption::Crypt

Parameters

rawText	Input data
key	Key
iv	IV vector

Returns

Returns encoded data

See also

QAESEncryption::Crypt, QAESEncryption::decode

Definition at line 391 of file qaesencryption.cpp.

Here is the call graph for this function:

7.5.4.5 QByteArray QAESEncryption::ExpandKey (QAESEncryption::Aes *level,* QAESEncryption::Mode *mode,* const QByteArray & *key*) `[static]`

ExpandKey Expands the key.

Parameters

level	AES level
mode	AES Mode
key	key

Returns

Returns expanded key (I guess)

See also

QAESEncryption::expandKey

Definition at line 18 of file qaesencryption.cpp.

Here is the call graph for this function:

7.5.4.6 QByteArray QAESEncryption::expandKey (const QByteArray & *key*)

ExpandKey Expands the key.

Note

Basically the non-static method of QAESEncryption::ExpandKey

Parameters

key	key

Returns

Returns expanded key (I guess)

See also

QAESEncryption::ExpandKey

Definition at line 132 of file qaesencryption.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.5.4.7 QByteArray QAESEncryption::RemovePadding (const QByteArray & *rawText,* QAESEncryption::Padding *padding*) `[static]`

RemovePadding Removes padding.

Parameters

rawText	Input data
padding	Padding

Returns

Returns data with removed padding (I guess)

See also

> QAESEncryption::removePadding

Definition at line 23 of file qaesencryption.cpp.

7.5.4.8 QByteArray QAESEncryption::removePadding (const QByteArray & *rawText*)

RemovePadding Removes padding.

Note

> Basically the non-static method of QAESEncryption::RemovePadding

Parameters

rawText	Input data

Returns

> Returns data with removed padding (I guess)

See also

> QAESEncryption::RemovePadding

Definition at line 490 of file qaesencryption.cpp.

- qaesencryption.cpp

7.6 ViewPC Class Reference

The ViewPC class View layer of the app. Controls EncryptDialog and ProgressDialog.

```
#include <viewpc.h>
```

Inheritance diagram for ViewPC:

Collaboration diagram for ViewPC:
Public Slots

- void alert (QString message, bool isWarning=false)

  ViewPC::alert Slot to create QMessageBox with message.
- void saveData (QByteArray Edata)

  ViewPC::saveData Slot to be called to save data using QFileDialog.
- void saveImage (QImage ∗image)

  ViewPC::saveImage Slot to be called to save image using QFileDialog.
- void setProgress (int val)

  ViewPC::setProgress Slot to set the value of the ProgressDialog (ViewPC::dialog).
- void abortCircuit ()

  ViewPC::abortCircuit Slot to close ProgressDialog (ViewPC::dialog)
- void setEncryptMode (bool encr)

  ViewPC::setEncryptMode Set the encrpt mode (ViewPC::isEncrypt)
- void setVersion (QString version)

  ViewPC::setVersion Set the version of the app from ControllerPC.

Signals

- void encrypt (QByteArray data, QImage ∗image, int mode, QString key)

  encrypt Signal calling ModelPC::encrypt
- void inject (QByteArray data, QImage ∗image, int mode, int bitsUsed)

  inject Signal calling ModelPC::inject
- void decrypt (QImage ∗_image, QString key, int mode)

  decrypt Signal calling ModelPC::decrypt
- void abortModel ()

  abortModel Signal calling to stop ModelPC::circuit
- void setJPHSDir (QString dir)

  setJPHSPath Sets the default JPHS directory

Public Member Functions

- ViewPC (QWidget ∗parent=nullptr)
- ∼ViewPC ()

  ViewPC::∼ViewPC Simple destructor for this layer.

Public Attributes

- QProgressDialog ∗ dialog

    dialog ProgressDialog used.
- bool progressDialogClosed

    progressDialogClosed Flag, if dialog is closed.
- QMap< QString, QString > errorsDict

    errorsDict QMap - Errors dictionary

Protected Slots

- void on_fileButton_clicked ()

    ViewPC::on_fileButton_clicked Slot to be called, when according button is pressed.
- void on_startButton_clicked ()

    ViewPC::on_startButton_clicked Slot to be called, when Start Button is pressed.
- void on_actionAbout_triggered ()

    ViewPC::on_actionAbout_triggered Opens about page.
- void on_actionHelp_triggered ()

    ViewPC::on_actionHelp_triggered Opens online documentation.
- void setupErrorsDict ()

    ViewPC::setupErrorsDict Setups errorsDict from strings.xml.

Protected Member Functions

- QString requestKey ()

    ViewPC::requestKey Request keyphrase from user using InputDialog.

7.6.1 Detailed Description

The ViewPC class View layer of the app. Controls EncryptDialog and ProgressDialog.

See also

7.6.2.1 ViewPC::ViewPC (QWidget ∗ *parent =* nullptr) [explicit]

Definition at line 4 of file viewpc.cpp.

Here is the call graph for this function:
7.6.2.2 ViewPC::∼ViewPC ( )

ViewPC::∼ViewPC Simple destructor for this layer.

Definition at line 19 of file viewpc.cpp.

Here is the call graph for this function:

ViewPC::~ViewPC	→	ViewPC::setEncryptMode

7.6.3 Member Function Documentation

7.6.3.1 void ViewPC::abortCircuit ( ) `[slot]`

ViewPC::abortCircuit Slot to close ProgressDialog (ViewPC::dialog)

Definition at line 218 of file viewpc.cpp.

Here is the caller graph for this function:

ViewPC::abortCircuit	←	ViewPC::setProgress

7.6.3.2 void ViewPC::abortModel ( ) `[signal]`

abortModel Signal calling to stop ModelPC::circuit

Here is the caller graph for this function:

ViewPC::abortModel	←	ViewPC::abortCircuit	←	ViewPC::setProgress

7.6.3.3 void ViewPC::alert (QString *message,* bool *isWarning =* `false`) `[slot]`

ViewPC::alert Slot to create QMessageBox with message.

Parameters

message	Message to be shown
isWarning	Flag, if message is critical.

Definition at line 132 of file viewpc.cpp.

Here is the caller graph for this function:
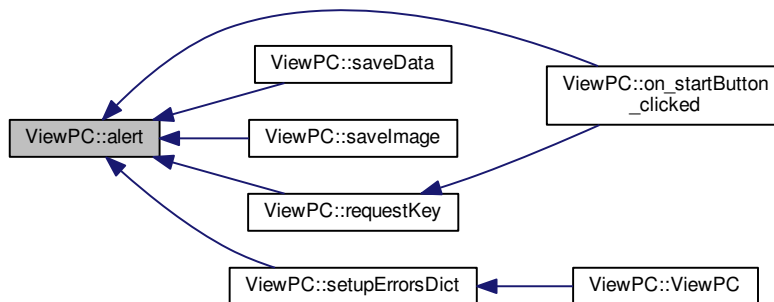

7.6.3.4 void ViewPC::decrypt (QImage ∗ _image, QString key, int mode) `[signal]`

decrypt Signal calling ModelPC::decrypt

Parameters

_image	Image for decryption
key	encryption key
mode	Mode of decryption

See also

ModelPC::decrypt, ModelPC::CryptMode

Here is the caller graph for this function:

7.6.3.5 void ViewPC::encrypt (QByteArray *data,* QImage ∗ *image,* int *mode,* QString *key*) `[signal]`

encrypt Signal calling ModelPC::encrypt

Parameters

data	Data to write
image	Image to be encrypted into
mode	Mode of encryption
key	Key of encryption

Here is the caller graph for this function:
7.6.3.6 void ViewPC::inject (QByteArray *data,* QImage ∗ *image,* int *mode,* int *bitsUsed*) `[signal]`

inject Signal calling ModelPC::inject

Parameters

data	Data to write
image	Image to be encrypted into.
mode	Mode of encryption
bitsUsed	Bits used per byte

Here is the caller graph for this function:

7.6.3.7 void ViewPC::on_actionAbout_triggered ( ) `[protected],[slot]`

ViewPC::on_actionAbout_triggered Opens about page.

Definition at line 275 of file viewpc.cpp.

Here is the call graph for this function:

7.6.3.8 void ViewPC::on_actionHelp_triggered ( ) `[protected],[slot]`

ViewPC::on_actionHelp_triggered Opens online documentation.

Definition at line 285 of file viewpc.cpp.

7.6.3.9 void ViewPC::on_fileButton_clicked ( ) `[protected],[slot]`

ViewPC::on_fileButton_clicked Slot to be called, when according button is pressed.

Definition at line 38 of file viewpc.cpp.

7.6.3.10 void ViewPC::on_startButton_clicked ( ) `[protected],[slot]`

ViewPC::on_startButton_clicked Slot to be called, when Start Button is pressed.

7.6.4 Encrypting

If Encrypting mode is active the data from text browser or from file from file selector will be opened and checked in size.

Note

 File size limit is 16MB

Then the EncryptDialog opens and image and key is selected. Then the ViewPC::encrypt signal is called to start ModelPC::encrypt

7.6.5 Decrypting

Else, the image from file selector is transmitted to ModelPC::decrypt

Definition at line 60 of file viewpc.cpp.

Here is the call graph for this function:

7.6.5.1 QString ViewPC::requestKey ( ) `[protected]`

ViewPC::requestKey Request keyphrase from user using InputDialog.

Returns

Returns keyphrase

Definition at line 255 of file viewpc.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.6.5.2 void ViewPC::saveData (QByteArray *Edata*) `[slot]`

ViewPC::saveData Slot to be called to save data using QFileDialog.

Parameters

Edata	Encrypted data to be saved.

See also

> ModelPC::encrypt

Definition at line 153 of file viewpc.cpp.

Here is the call graph for this function:

```
┌─────────────────┐        ┌─────────────────┐
│ ViewPC::saveData│ ─────▶ │  ViewPC::alert  │
└─────────────────┘        └─────────────────┘
```

7.6.5.3   void ViewPC::saveImage (QImage ∗ *image*) `[slot]`

ViewPC::saveImage Slot to be called to save image using QFileDialog.

Parameters

image	Image to be saved.

See also

> ModelPC::decrypt

Definition at line 174 of file viewpc.cpp.

Here is the call graph for this function:

```
┌──────────────────┐        ┌─────────────────┐
│ ViewPC::saveImage│ ─────▶ │  ViewPC::alert  │
└──────────────────┘        └─────────────────┘
```

7.6.5.4   void ViewPC::setEncryptMode (bool *encr*) `[slot]`

ViewPC::setEncryptMode Set the encrpt mode (ViewPC::isEncrypt)

Parameters

encr	= isEncrypt, true if encrypting, false if decrypting

Definition at line 231 of file viewpc.cpp.

Here is the caller graph for this function:

7.6.5.5 void ViewPC::setJPHSDir (QString *dir*) `[signal]`

setJPHSPath Sets the default JPHS directory

Parameters

dir	Directory

Here is the caller graph for this function:

7.6.5.6 void ViewPC::setProgress (int *val*) `[slot]`

ViewPC::setProgress Slot to set the value of the ProgressDialog (ViewPC::dialog).

Parameters

val	New value of the dialog. If -1, creates ProgressDialog, if 101 closes the dialog.

See also

> ViewPC::abortCircuit(), ModelPC::setProgress()

Definition at line 192 of file viewpc.cpp.

Here is the call graph for this function:

7.6.5.7   void ViewPC::setupErrorsDict ( ) `[protected],[slot]`

ViewPC::setupErrorsDict Setups errorsDict from strings.xml.

Definition at line 293 of file viewpc.cpp.

Here is the call graph for this function:
Here is the caller graph for this function:

7.6.5.8   void ViewPC::setVersion (QString *version*) `[slot]`

ViewPC::setVersion Set the version of the app from ControllerPC.

Parameters

version	Version as QString

Definition at line 246 of file viewpc.cpp.

Here is the caller graph for this function:

| ViewPC::setVersion | ◀── | ControllerPC::ControllerPC |

7.6.6 Member Data Documentation

7.6.6.1 QProgressDialog∗ ViewPC::dialog

dialog ProgressDialog used.

Classes

- class QAESEncryption

  The QAESEncryption class Small and portable AES encryption class for Qt. Supports all key sizes - 128/192/256 bits - ECB, CBC, CFB and OFB modes. Class made entirely by bricke. Github: `https://github.com/bricke/↩Qt-AES`.
